No, this mod involves a series RC to ground from pin 1 and then another series RC to the output. Gains up to 74dB can be achieved with this technique- but stability becomes an issue when pushing to the hi end of this range.

Subject: [X1M_QRP-Transceiver] RE: X1M Boards

I stand corrected -- looking at the original schemastics I finally found it. Looks like they've got the cap and resister jumping those pins which sets it at the '50' level about or at least between 20 and 200. So I'm going to guess your mod is to remove the resistor from the circuit and let it go to '200' with just the cap in series.

I'm really enjoying playing 'guess the mod'! It reminds me of how I learned computers -- I'd break them while my dad was at work. Things like delete the entire windows 3.1 directory, or set a password on a screen saver and then forget it, etc. When my dad would get home he'd call my uncle who would come over and fix it. So I started to basically try and guess how to fix it before he would get home so my uncle didn't get called. For some reason trying to guess your mod before you tell us sort of reminds me of that learning process.

So it goes.

Hot diggly Dale that is great news!! Glad my curiosity could spark curiosity in you to double check the schematics! cracked open my ver II and measured the resistor at 1k. So I'd say it looks likely that if a mod is here it will work for both models.

And to John - it does look like the out put from the LM386 goes pretty straight to the headphones jack so it is possible that the mod might be to much on that side. Dale once you jumper it would you mind reporting back how the headphone side behaves?

ï»¿

Hello Group,

While looking at the area around the LM386 I thought I would measure the resistor (R80C) that is in series with the 10uF electrolytic (C155C) between pins 1 and 8. The schematic shows 470 Ohms, so initially I had dismissed the mod that Chris mentioned as not being worthwhile because of the low gain improvement. It turns out on my Pro version at least the resistor is 1K. By shorting it out I got exactly 12dB of gain. Now, while there is likely still not enough system gain for AGC, it does make the rig much more lively (at least on my signal generator) with the internal speaker. No signs of instability. R80C is on the bottom of the top board and C155C is also on the bottom to the right of the LM386. Both are accessible without having to separate the boards.

I soldered a piece of #30 wire wrap to pin 1 on the bottom and a 2nd piece to the (+) side of C155C (10uF). By shorting these two together I could easily measure the voltage gain. I'll put a jumper across R80C and see what it sounds like on the bands.

Chris- thank you for mentioning this mod, otherwise I likely would have dismissed it as not yielding enough gain.

More to follow,

Dale W4OP

THE MICROPHONE PUZZLE IS SOLVED!

I read all the recent discussions about digital mode hookups and the light went on for me when somebody mentioned the bias current being incorrect. That's when it hit me: the X1M needs the extra current draw from the PTT LED in the mic! As soon as I added a red LED in series with 4.7k between tip and ring of the mic plug, my PC headset mic started working.

I now have a very nice little adapter to use my PC headset on the X1M. Here are the final connections:

X1M Sleeve ------------------- (GND) ------------------ Mic Sleeve

X1M Ring ------------ Pushbutton --------- GND

X1M Ring ------------ |< -LED+ ------- 4.7k ----- X1M Tip

X1M Tip ----------- Mic Tip & Mic Ring

The pushbutton acts as PTT when I'm using the headset. When I get around to it I'll add a NO jack across the pushbutton for a foot switch and have full hands-free operation.

Hope this helps anyone who's trying to do something similar. Give me a shout if you have any questions.

OK, so last night I bit the bullet and completely traced the circuitry inside the stock mic. The only additional components are:

- A .01uf disc cap across the mic cartridge. I assume this is just there for RF bypass and high frequency rolloff. It shouldn't be required for the mic to function, right?
- A 4k7 resistor in series with an LED between tip and ring. This is obviously the transmit light on the front of the mic.

There are a few other items related to the disabled speaker in the stock mic. For the X1M, none of these are ever in-circuit.

After looking at all this, the only conclusion I can reach is that the stock mic cartridge has much higher output than a PC headset mic. Before I go hunting for a mic preamp, could somebody please prove me wrong?

1308. Trim pots on Ver II

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-08 03:26:54 UTC
From: <orders@...>
Topic: 1308 Message: 1308

Hey gang,

The trim pots in my ver II are in different locations that the ones in the PRO (as shown in the manual). I thought maybe I had missed something but I doubled checked and sure enough they are not at all in the same spots as the PRO. I originally went in to change the mic gain and randomly choose the right 'most' pot to turn and I *think* it worked. Anyone know for sure? I uploaded a photo of my section of the board in the photos section so anyone can see the difference themselves. If others with the ver II are out there this would be good to know or maybe we should create an addendum to the PRO manual for any big differences for us.

Haha this is what I get for using the web based group messages -- I totally responded out of order! I asked about the details of your proposed mod before I read that you had looked into my mod! Either way thank you for that explanation of the lm386 gain circuit -- it makes perfect sense and actually gives me a deeper understanding of what and HOW it is doing it. Much appreciated! And much appreciated to have you digging into the guts of this awesome little feller!

So am I reading that correct that just by jumping the resistor you've gotten that much more gain and think an AGC circuit is possible now? That is fantastic news!!

-Chris

--- In x1m_qrp-transceiver@yahoogroups.com, <parinc1@...> wrote:

ï»¿
Hi Chris,

If you look at what is inside the 386, you will see a 1.35K (?) internal resistor that effectively sets the gain of the amplifier. By placing a large cap in parallel, you give the audio another path (lower impedance in this case) to follow and increasing the gain. By choosing different values, you can shape the audio response. Smaller values will reduce low frequency gain. By placing a resistor in series with the cap you add another break point in the audio spectrum- the gain will increase as you go up in frequency until the capacitor reactance is much less than the external series resistor and will then flatten out.

At least that is my understanding and if incorrect- please correct me.

Anyway, there is now lots of gain and I am running the volume just cracked open- probably enough for AGC now w/o further audio chain mods.

The little rig continues to impress me.

Dale W4OP

Dale - Interesting! I'm certainly looking forward to how it works. I'm still scratching my head on what that exactly does electrically as I'm newly digging into all of this but it gives me one more thing to tease apart so thanks!

1310. RE: Trim pots on Ver II

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-08 03:40:17 UTC
From: <orders@...>
Topic: 1308 Message: 1310

I think I answered my own question now that I am looking closer. I followed the leads and it looks like the right most pot on the ver II IS the microphone trimmer -- it goes through a resistor to the same approximate place as on the PRO. I *think*. If anyone can confirm or deny that I'd appreciate it.

1311. Sidebands on SDR

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-08 03:43:11 UTC
From: <lphebus@...>
Topic: 1311 Message: 1311

I just un-boxed my X1M Platinum. I ran the TX into a dummy load and turned on my SoftRock Ensemble II SDR. There is enough RF despite the dummy load to register on the SDR, which is about 1 foot away. As you can see in the photos section, the sidebands of the X1M need some adjusting, The USB bleeds into the LSB and the LSB is weaker than the USB (all done at 7.280MHz). I'm sure this will be worked out in the adjustments I plan to perform. Also, the bandwidth of the SSB signal is well shy of the standard 2.7kHz. I suspect this is a limitation of the mike, which I suspect is the weakest link in the X1M rig. Just for reference, I added a similar test using an ICOM 7000 running 5W output and a MST400 kit LSB 40M transceiver (www.ozQRP.com) I built. I alternated LSB and USB for the X1M and the ICOM. The MST is only LSB. I used a Diamond SX-200 meter set at 5W full scale to run all three transceivers at about 2W peak (by eyeball).

Lee

1313. Keyer

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-08 04:17:43 UTC
From: Dale Parfitt
Topic: 1149 Message: 1313

Does anyone in the group have a memory scope? Mine has every feature but memory. I am trying to evaluate the keyer characteristics and tearing my hair out.
The keying line is available on the edge connector right above the tuning encoder- 4th pin from the right - be careful.
Ideal Morse characters (from memory) are:
1. Dot= 1 unit length
2. Dash= 3 unit lengths
3. Length between consecutive dots or dashes= 1 unit length

The other basic feature we need is dot and dash memory. That is, if you send, say an N, faster than the keyer speed- the keyer remembers you hit the dot side even before the dash completes etc.

Tnx,
Dale W4OP

1314. Newbie needs help!

Yahoo group: X1M_QRP-Transceiver (2013)

From: <k4tql@...>
Topic: 1314 Message: 1314

I've just joined the group. I'm not a newbie ham (50 plus years) but I am a newbie X1M owner. I haven't had a chance to read all the posts so I need a quick update from someone who, perhaps, has.

I picked this gem up at a hamfest yesterday and it appears to work. Gets a little warm but that's expected with so much in a tiny package. No, it's not a KX3 but I didn't pay the price either.

This rig appears to be the original version with the already defined buttons (not F1, F2, etc) on the front and small display. I can't tell when it was manufactured because there is no serial number, version number or date of manufacture. My questions are:

1. Have there been any firmware upgrades to this version. Part B: will there be any firmware upgrades to this version.

2. What is the difference between my version and the one with the F1, F2, etc. buttons on the front?

3. What is the Pro version? Is it my version upgraded somehow? I know it's not the Platinum because of the small display.

4. Has there been enough information released by the manufacturer so that third parties could attempt upgrades, warranties be darned?

This little unit appears to do what I want it to do. It has warts but being somewhat SDR, it should be improvable with some experimentation (probably by someone much smarter than me).

My thanks for your response(s) in advance.

1315. Fun with first version X1M

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-08 13:49:08 UTC
From: <neilgoldstein@...>
Topic: 1315 Message: 1315

I drove up to the highest point on Long Island yesterday for some X1M operations. I raised an antenna into a nearby maple with some twine and a bottle of water for a counterweight, and worked England, Germany, and Denmark on 15M, as well as Denmark on 20M. I almost had Cyprus, as he heard me but faded when I repeated the call. This is a fun little rig even with the shortcomings. I'm looking forward to any way to improve on it, but my set up, operating out of the back of my Kia Soul from the 12V plug in the hatch, with some wire in the trees,and my Emtech ZM2 tuner is working just fine.

I spoke with Dale at Kight a couple of weeks ago, and he said that he had been shorted on the new rigs. They sent half of what they were supposed to. Then I got an email from Ed telling me that he would now be providing any new rigs, and that Kight was no longer selling them. Not sure whether that includes the warranty replacements or not. I originally thought that my rig was not working on 10M correctly, as you cannot hear the filters "click-in" for 10. Since then I have learned that it is working fine, and there are no filters that activate for 10, as it uses the default LPF that is there when no other filters are selected.

Ed mentioned in his reply to me about exchanges that he was still hoping to offer an upgrade kit from the factory to update the older models to the newer model. In the meantime, I'm considering making or buying some LPFs to correct the range on 75, and 40, as well as being able to use it on 17 and 12.

Hopefully they'll get the CW issues ironed out before I learn CW ;-)

Have fun with your rigs folks, and keep the great information flowing!

Hi Bruce,

WELCOME TO THE FUN! Let's get you up to speed.....

a) The one you've got is often called ver II around here -- I have it as well.

1) No firmware upgrades yet. Not sure but HOPING there will be some in the future. This applies both to the Pro and the version II (at this time)

2) From what I can tell it is mostly a bigger screen (I prefer my tiny one) and a newer firmware to run that screen and a few things that come with it. The big one that I know of is that the LPF's cover the entire 40m band and the other band the ver II stops short off. There is difference in the layout of the PCB and some of the parts but I'm not sure how extensive or what that exactly does... I don't have a Pro version so someone else might have some more info for you on that one.

3) Pro and Platinum are the same model. Platinum came out of a 'bad' translation before it was released but once folks got it the firmware called it the Pro. So there are really only 2 models floating out there 1) ver II and 2) Pro OR Platinum

4) There is a set of schematics in the files upload section. It is the ver II schematics (good for you!) but they seem to be closely related to the Pro model so folks are working on that side too.

Most importantly welcome to the crew! And join the experimentation that is learning the quirks and mods of the x1m. Also -- if you haven't found it yet.... there is a manual for the Pro version in the files upload section. It isn't exact as far as menu screen shots go for the ver II but the alignment process by Heath in there you should give it a go and it generally is a good place to start. Most of the repeatable tips and tricks have found there way into the document.

I've just joined the group. I'm not a newbie ham (50 plus years) but I am a newbie X1M owner. I haven't had a chance to read all the posts so I need a quick update from someone who, perhaps, has.

I picked this gem up at a hamfest yesterday and it appears to work. Gets a little warm but that's expected with so much in a tiny package. No, it's not a KX3 but I didn't pay the price either.

This rig appears to be the original version with the already defined buttons (not F1, F2, etc) on the front and small display. I can't tell when it was manufactured because there is no serial number, version number or date of manufacture. My questions are:

1. Have there been any firmware upgrades to this version. Part B: will there be any firmware upgrades to this version.

2. What is the difference between my version and the one with the F1, F2, etc. buttons on the front?

3. What is the Pro version? Is it my version upgraded somehow? I know it's not the Platinum because of the small display.

4. Has there been enough information released by the manufacturer so that third parties could attempt upgrades, warranties be darned?

Hi Charlie,

I suspect that only some radios have an additional "position' in the socket.
I noticed that mine only has 'part' of an extra 'hole' so was obvious where the pins should go.

Dale, as above, you *may* have more sockets than pins. It's MUCH easier to assemble than in my video.

Hi Chris,

What I noticed, is that if the alignment settings had been changed from the default values (as I did to fix the alignment), applying the firmware updated had no effect on these values, ie, they remained just as I had set them, not as the 'default values'. Not much more technical I can be in this case, sorry! :-)

Fred,

I highly doubt that this supposed 'NEW' firmware which several of us have just just tried is actually 'NEW'. Whilst it's been 'newly' available for us to do the 'upgrade' ourselves, it's dated 20th July, so it's the same date that perhaps most PRO users have anyway, now some 6 weeks old.

I've been providing the factory with feedback on most points people have been discussing on this list, as well as points people have emailed me privately. Many of these points have been in the last couple of weeks, and some as recent as last week.

I doubt that we will see a firmware update made public for quite a while, though fingers are crossed that the latest shipped radios will already have corrected firmware.

A point to note here, is that the firmware has NO EFFECT on the alignment settings, so a firmware update will not automatically fix the issues with IF Offset's and the terrible default LSB BFO settings.

Chris,

As soon as I hit send, I thought that perhaps doing the firmware update requires a 'factory reset', and could be why some have experienced problems after doing the firmware update, and why the alignment values didn't change!

Thanks Heath for your experience. My brain is clicking away to see what it thinks. It seems likely they are storing the actual values in a non-volatile memory either in a non-flashed part of the MCU or another location. So it COULD make sense that flashing the firmware doesn't touch the 'saved' settings -- like upgrading windows but leaving the installed files in place.

If that is the case I think you're right -- if someone reset to factory defaults then maybe we'd see different defaults than before.

So I agree that is curious. Maybe I'll go poking at the schematics and see if they tell me anything....

I just thought of something else -- folks are thinking the flashed firmware is actually the same firmware they already have. So perhaps that is the missing link -- it really isn't different firmware at all so the offsets aren't different.

Anyway -- more to poke at!

Thanks,
-Chris

It is certainly possible for the sockets to vary on the number of pins . Mine has a full extra hole . However they appear to be manually breaking off the number of pins they need since all of the sockets that I have looked at do not have a nice clean edge .

Topic: 1268 Message: 1329

Chris and All,
I don't think having new firmware change the alignment defaults is a real critical issue for many folks. The radio uses all 9.000 MHz crystals in the sideband filters, and finding a common value of offsets which will work for the majority of radios may not be possible. That will probably still be a radio-by-radio alignment issue. Perhaps the factory, rather than the proud new owners, could do it, but that would slow delivery and probably raise costs.
I believe the most serious firmware issues in the Pro have nothing to do with the offset values reflected in the setup menu.. CW offset for receiving, and RIT and SPLIT mode functioning in all modes, are controlled by the firmware's VFO management. Which VFO is being used for receiving and which for transmitting (SPLIT mode) and whether a small adjustment to the VFO is made going from receive to transmit and vice-versa (RIT and CW operation) appear to be the problem areas in the present code causing me the most grief. I have heard that these functions worked correctly in the version II sets. If that is true it should not be hard to fix in the Pro. How does that go? "...It's just a matter of programming..."
Good luck with your new mic project. I suspect the results will be well worth the effort.
Ken, W1KRT

On Sep 8, 2013, at 11:05 AM, <orders@...> wrote:

Thanks Heath for your experience. My brain is clicking away to see what it thinks. It seems likely they are storing the actual values in a non-volatile memory either in a non-flashed part of the MCU or another location. So it COULD make sense that flashing the firmware doesn't touch the 'saved' settings -- like upgrading windows but leaving the installed files in place.

If that is the case I think you're right -- if someone reset to factory defaults then maybe we'd see different defaults than before.

So I agree that is curious. Maybe I'll go poking at the schematics and see if they tell me anything....

I just thought of something else -- folks are thinking the flashed firmware is actually the same firmware they already have. So perhaps that is the missing link -- it really isn't different firmware at all so the offsets aren't different.

Anyway -- more to poke at!

Thanks,

-Chris

Chris,

As soon as I hit send, I thought that perhaps doing the firmware update requires a 'factory reset', and could be why some have experienced problems after doing the firmware update, and why the alignment values didn't change!

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:

Hi Heath,

Thanks for everything you are doing to communicate back to the factory for all of us -- I personally really appreciate knowing that someone who is active in both communities is actively participating around here. So a big old hat tip to you from me!

I'm curious to know more details about why the firmware has no effect on the alignment settings? I'd appreciate a deeper understanding of that sentence. You can PM me if you like or post it here. Give it to me in all the technical/electrical details!

Anyway -- thanks again,

-Chris

Fred,

I highly doubt that this supposed 'NEW' firmware which several of us have just just tried is actually 'NEW'. Whilst it's been 'newly' available for us to do the 'upgrade' ourselves, it's dated 20th July, so it's the same date that perhaps most PRO users have anyway, now some 6 weeks old.

I've been providing the factory with feedback on most points people have been discussing on this list, as well as points people have emailed me privately. Many of these points have been in the last couple of weeks, and some as recent as last week.

I doubt that we will see a firmware update made public for quite a while, though fingers are crossed that the latest shipped radios will already have corrected firmware.

A point to note here, is that the firmware has NO EFFECT on the alignment settings, so a firmware update will not automatically fix the issues with IF Offset's and the terrible default LSB BFO settings.

Ken , I agree with you too . First priority is a good stable version addressing those issues first and I suspect some CW timing issues .

I don't know where the Version II designator came from , but I have one of each model that I am aware of that is on the market . The Pro is easily confirmed by pressing down and holding F5 it will show "Pro" and your serial number .

I find the same CW issues on both rigs .

If you pick one of these up at a hamfest well worth the investment in my opinion . Yes both versions have a few bugs , but for a new radio and the price I expected that going in . The factory does seem to be more than willing to correct the problems with upgrades , but they are VERRRRRY slow at doing it .

It is not for a person that does not have patience to wait on some mods and upgrades , primarily CW related . But if you operate SSB / QRP GRAB one up and use the heck out of it . BE SURE to do the simple user sideband setup as explained in the manual . I have already had mine portable for 4 days and when I am not looking into different ways to modify and "customize" it for my method of operation , II have it running all the time and look for a few QSO's .

Dale my scope is a memory scope , just my memory is the problem. <grin>

Just my fun and experience with it .

Microphone comes with it (at least in the colonies). Also, get the RS232 adapter, if you wish to use it with HRD/DM780. Also <gasp>, read the user's guide (under files section)

Steve it will be great to see one get into your hands . I am certain
that besides having fun , you will come up with some interesting uses
and additions for it .

Great to see the builders and experimenters getting these into their hands .

I hope that you post a schedule of what mode and time you are on in
Hungary .

I added a picture of the sidebands after a "by ear" alignment as described by VK3TWO

http://www.youtube.com/watch?v=EUO_AgRh7H4&feature=c4-overview&list=UUzLVwycdcUU_yJd8CavjBVg

Lee

--- In x1m_qrp-transceiver@yahoogroups.com, <lphebus@...> wrote:

I just un-boxed my X1M Platinum. I ran the TX into a dummy load and turned on my SoftRock Ensemble II SDR. There is enough RF despite the dummy load to register on the SDR, which is about 1 foot away. As you can see in the photos section, the sidebands of the X1M need some adjusting, The USB bleeds into the LSB and the LSB is weaker than the USB (all done at 7.280MHz). I'm sure this will be worked out in the adjustments I plan to perform. Also, the bandwidth of the SSB signal is well shy of the standard 2.7kHz. I suspect this is a limitation of the mike, which I suspect is the weakest link in the X1M rig. Just for reference, I added a similar test using an ICOM 7000 running 5W output and a MST400 kit LSB 40M transceiver (www.ozQRP.com) I built. I alternated LSB and USB for the X1M and the ICOM. The MST is only LSB. I used a Diamond SX-200 meter set at 5W full scale to run all three transceivers at about 2W peak (by eyeball).

Hi Charlie,

Nice to hear from you. There are a lot of interesting aspects to the radio just made for experiments. As you might know I work with a few keen homebrewers in the European QRP community. When my set arrives we will do some measurements on it. One thing i am keen to try is to see if I can interface it with a Rasberry Pi running Fldigi. I will report back any info to the group.... If only the firmware was in the public domain we could have some real fun.

I have used FLDIGI on the RPi and a SignaLink USB interface to my FT-817ND. I could generate a PSK-31 signal, but the processor in the RPi was not fast enough to decode things. I think I would have to overclock the RPi. As to digital interface to the X1M, it is a snap. I have interefaced the X1M to the SignaLink though the microphone and headphone jacks. Pinout for the microphone on this site in the User's Guide. I have gotten PSK-31 to run on X1M with HRD/DM780, so if you can crank the RPi up fast enough, I see no reason it should not work.

Interfacing a regular microphone to the X1M seems to require an extra LED -- see the discussion on the topic. I haven't tried that, as yet. On my list...

OK, my third post on this lonely thread. I am concerned that this transceiver does not adequately "lop off" the unused side band. I have posted a 4th picture of my X1M platinum rig signal on an SDR waterfall after aligning it according to the method described in the "more detailed manual" on http://www.wouxun.us/item.php?item_id=302
I used the program ARGO to match the sideband signals. As you can see from the most recent picture, the LSB and USB transmit images in the SDR frequency domain are nicely symmetrical... the rig is balanced, but there is significant signal in the unwanted sideband.

From looking at the top of the board, this rig uses a crystal ladder filter to slice off the unwanted sideband once the carrier has been stripped by a balanced modulator... correct? Most rigs that use this method are dedicated LSB or USB, or they use separate ladder filters. Is it possible that using a single ladder filter for both sidebands introduces just too many compromises? Check out the pictures and comparison to the ICOM (3-4X the price) and the MST-400 dedicated LSB rig.

There was a previous thread on this issue http://www.wouxun.us/item.php?item_id=302
Maybe we need 2 sets of alignment parameters, one for LSB and one for USB. I am a bit disappointed... This may be the unmentioned elephant in the room...

I just un-boxed my X1M Platinum. I ran the TX into a dummy load and turned on my SoftRock Ensemble II SDR. There is enough RF despite the dummy load to register on the SDR, which is about 1 foot away. As you can see in the photos section, the sidebands of the X1M need some adjusting, The USB bleeds into the LSB and the LSB is weaker than the USB (all done at 7.280MHz). I'm sure this will be worked out in the adjustments I plan to perform. Also, the bandwidth of the SSB signal is well shy of the standard 2.7kHz. I suspect this is a limitation of the mike, which I suspect is the weakest link in the X1M rig. Just for reference, I added a similar test using an ICOM 7000 running 5W output and a MST400 kit LSB 40M transceiver (www.ozQRP.com) I built. I alternated LSB and USB for the X1M and the ICOM. The MST is only LSB. I used a Diamond SX-200 meter set at 5W full scale to run all three transceivers at about 2W peak (by eyeball).

Hi there,

Have you made this mod on the X1M-PRO? If so, does the audio clipping problem still occur at high volume levels (above 3 o'clock on big rx signals)?

i.e, Does it still clip but now at a lower position (say 12 o'clock) on the volume knob?

Cheers

Perrin

Hi Paul and the group,

I believe that if you uncheck the "Multi channel Decoder" option in the "Modems PSK" menu choice under the "Configure" option, then go to the "Misc" tab and check "Slow CPU" you should be good to transmit everything apart from RTTY on a Pi. This is according to G4WNC's data mode column in Practical Wireless August 2013.

Hope this helps,

Steve G0XAR

I'll have my SA back in the shop this Friday and will take another look. My first test was using the Elecraft P3 and I find it can be misleading on in-shop signals.

The test I just did, anyone can perform and it shows the SSB RX filtering to be very good. While I used a signal generator, you can use a ground wave AM broadcast station.

Set the rig to USB or LSB and tune across the carrier- the louder the signal the better. On the appropriate sideband you will of course hear the heterodyne. As you go down to zero beat and cross over to the opposite side, the heterodyne should be greatly reduced. Using a scope or AC voltmeter (that is accurate in the audio range) you can plot the filter response.

So on RX at least my filter looks excellent. I am hoping the TX signal also passes through this filter.

CW BTW, at least the way I have it set shows response on both sidebands, so I need to look at where in the filter I have the carrier placed.

Thanks Dale,

RX sounds good on my X1M too. It is the TX that concerns me. Under the same test circumstances, my two other rigs look OK but the X1M perhaps a bit "iffy". I would be grateful for any tests you could perform.

W9RWS, in the previous thread, could tune the rig so that one sideband looked very good, at the expense of the other. If necessary, one could have a optimized set of parameters for LSB and one for USB. This could even be incorporated into the software... but I am getting way ahead of myself...

Thanks again,

Lee

Pinout for the microphone on this site in the User's Guide. I have gotten PSK-31 to run on X1M with HRD/DM780, so if you can crank the RPi up fast enough, I see no reason it should not work.

Interfacing a regular microphone to the X1M seems to require an extra LED -- see the discussion on the topic. I haven't tried that, as yet. On my list...

Hi Charlie,

Nice to hear from you. There are a lot of interesting aspects to the radio just made for experiments. As you might know I work with a few keen homebrewers in the European QRP community. When my set arrives we will do some measurements on it. One thing i am keen to try is to see if I can interface it with a Rasberry Pi running Fldigi. I will report back any info to the group.... If only the firmware was in the public domain we could have some real fun.ÃÂ

My Drake TR-7 was the first radio I saw that uses one filter and moves the oscillator. So this is not new.

I totally agree Ken too that the offsets are realy not that big of a deal. Just another curious thing to go poking at and learning about as it comes across the plate!
-Chris

--- In x1m_qrp-transceiver@yahoogroups.com, <cvest@...> wrote:

Ken , I agree with you too . First priority is a good stable version addressing those issues first and I suspect some CW timing issues .

I don't know where the Version II designator came from , but I have one of each model that I am aware of that is on the market . The Pro is easily confirmed by pressing down and holding F5 it will show "Pro" and your serial number .

I find the same CW issues on both rigs .

If you pick one of these up at a hamfest well worth the investment in my opinion . Yes both versions have a few bugs , but for a new radio and the price I expected that going in . The factory does seem to be more than willing to correct the problems with upgrades , but they are VERRRRRY slow at doing it .

It is not for a person that does not have patience to wait on some mods and upgrades , primarily CW related . But if you operate SSB / QRP GRAB one up and use the heck out of it . BE SURE to do the simple user sideband setup as explained in the manual . I have already had mine portable for 4 days and when I am not looking into different ways to modify and "customize" it for my method of operation , II have it running all the time and look for a few QSO's .

Dale my scope is a memory scope , just my memory is the problem. <grin>

Just my fun and experience with it .

Charlie , W5COV

On 9/8/2013 11:49 AM, Ken Downs wrote:

Chris and All,

I don't think having new firmware change the alignment defaults is a real critical issue for many folks. The radio uses all 9.000 MHz crystals in the sideband filters, and finding a common value of offsets which will work for the majority of radios may not be possible. That will probably still be a radio-by-radio alignment issue. Perhaps the factory, rather than the proud new owners, could do it, but that would slow delivery and probably raise costs.

I believe the most serious firmware issues in the Pro have nothing to do with the offset values reflected in the setup menu.. CW offset for receiving, and RIT and SPLIT mode functioning in all modes, are controlled by the firmware's VFO management. Which VFO is being used for receiving and which for transmitting (SPLIT mode) and whether a small

adjustment to the VFO is made going from receive to transmit and vice-versa (RIT and CW operation) appear to be the problem areas in the present code causing me the most grief. I have heard that these functions worked correctly in the version II sets. If that is true it should not be hard to fix in the Pro. How does that go? "...It's just a matter of programming..."

Good luck with your new mic project. I suspect the results will be well worth the effort.

Ken, W1KRT

On Sep 8, 2013, at 11:05 AM, <orders@...> wrote:

Thanks Heath for your experience. My brain is clicking away to see what it thinks. It seems likely they are storing the actual values in a non-volatile memory either in a non-flashed part of the MCU or another location. So it COULD make sense that flashing the firmware doesn't touch the 'saved' settings -- like upgrading windows but leaving the installed files in place.

If that is the case I think you're right -- if someone reset to factory defaults then maybe we'd see different defaults than before.

So I agree that is curious. Maybe I'll go poking at the schematics and see if they tell me anything....

I just thought of something else -- folks are thinking the flashed firmware is actually the same firmware they already have. So perhaps that is the missing link -- it really isn't different firmware at all so the offsets aren't different.

Anyway -- more to poke at!

Thanks,

-Chris

--- In x1m_qrp-transceiver@yahoogroups.com, <vk3two@...> wrote:

Chris,

As soon as I hit send, I thought that perhaps doing the firmware update requires a 'factory reset', and could be why some have experienced problems after doing the firmware update, and why the alignment values didn't change!

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:

Hi Heath,

Thanks for everything you are doing to communicate back to the factory for all of us -- I personally really appreciate knowing that someone who is active in both communities is actively participating around here. So a big old hat tip to you from me!

I'm curious to know more details about why the firmware has no effect on the alignment settings? I'd appreciate a deeper understanding of that sentence. You can PM me if you like or post it here. Give it to me in all the technical/electrical details!

Anyway -- thanks again,

-Chris

KC8MUS

--- In x1m_qrp-transceiver@yahoogroups.com, <vk3two@...> wrote:

Fred,

I highly doubt that this supposed 'NEW' firmware which several of us have just just tried is actually 'NEW'. Whilst it's been 'newly' available for us to do the 'upgrade' ourselves, it's dated 20th July, so it's the same date that perhaps most PRO users have anyway, now some 6 weeks old.

I've been providing the factory with feedback on most points people have been discussing on this list, as well as points people have emailed me privately. Many of these points have been in the last couple of weeks, and some as recent as last week.

I doubt that we will see a firmware update made public for quite a while, though fingers are crossed that the latest shipped radios will already have corrected firmware.

A point to note here, is that the firmware has NO EFFECT on the alignment settings, so a firmware update will not automatically fix the issues with IF Offset's and the terrible default LSB BFO settings.

Hi Perrin,
I have the rig back together, but the resistor is directly under LM386 on the PRO version and can be IDed by confirming that one end goes to pin 1 and the other end goes to the electrolytic which is also on the underside of the top board. W5COV reports that the resistor is on the top of the orignal version board which makes the mod even simpler. With the extra gain, I seldom use the preamp now.

I modified the original version. The non pro version and it is easily done with just the top cover removed . There is plenty of room even if you don't do SMD work to make the change . All solder connections needed are in plain sight on top of the board . If anyone needs help I can describe it in more detail but it is the resistor right off of pin 1 in front of the notch on the LM386 .

BTW it is also a 1K resistor in the one I have .

There is enough RF despite the dummy load to register on the SDR, which is about 1 foot away. As you can see in the photos section, the sidebands of the X1M need some adjusting, The USB bleeds into the LSB and the LSB is weaker than the USB (all done at 7.280MHz). I'm sure this will be worked out in the adjustments I plan to perform. Also, the bandwidth of the SSB signal is well shy of the standard 2.7kHz. I suspect this is a limitation of the mike, which I suspect is the weakest link in the X1M rig. Just for reference, I added a similar test using an ICOM 7000 running 5W output and a MST400 kit LSB 40M transceiver (www.ozQRP.com) I built. I alternated LSB and USB for the X1M and the ICOM. The MST is only LSB. I used a Diamond SX-200 meter set at 5W full scale to run all t hree transceivers at about 2W peak (by eyeball).

Dale, I generated the RX SSB filter graph you suggested and posted it in the photos section. I rounded to the nearest dBm so it is a little bumpy...

Dale, in the "photos" section there is an album titled "USB and LSB on an SDR". In it are 3 images of the X1M side bands as seen on a SDR waterfall...

X1M = the radio as received from the vendor
X1M after by ear alignment = after the youtube video alignment method
X1M aligned according to manual = balanced by ear then fine tuned using ARGO software
See the original post in this thread for details...

Also, take a look at the RX side bands graph!

I hope I have answered the question you were asking ;-)

1359. Still Waiting For An Answer From KightRadio.com

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-10 03:41:27 UTC
From: <gedanate@...>
Topic: 1359 Message: 1359

I have seen other X1M buyers complain in this Group about KightRadio ignoring them, and I have stuck up for KightRadio in the past, defended them from all kinds of angry comments.

I sent in my money as a pre-paid order back in May, and I have gotten to the point where I am not willing to wait any more.

Dale used to answer my emails, months ago, but the last answer I received from him (whan i said gimme me radio or refund my money!) just said "Are you receiving my emails?" and it said absolutely nothing else. It didn't say what was happening.

Since that time I have emailed a further 5 or so enquiries, and all of them have been ignored. So I now feel rather negatively towards KightRadio, since they have not handled the situation at all well, as far as I can see.

Is the Dale I have recently seen discussing this little transceiver the same Dale who once replied to me politely from KightRadio, or are they two different people?

I do know the factory has been very very slow in sending KightRadio the units they had ordered, but from what I have been reading in here for all these months, the radio still has so many things wrong with it I am not comfortable with the idea of trying to fix the thing when (or if) I ever get one.

So I want my money back, unless I know I will get one with all the fixes - such as the CW alignment - done properly by the factory.. Then again, I might well die of old age waiting.

What do you suggest, guys? And Dale, are you the guy I should be talking to or is that Dale somebody else? I have already paid KightRadio for the rig, so if they can't supply it, they ought to refund me. I am certainly not willing to pay twice for the radio.

73 de David Harvey, vk2dmh.

Topic: 1359 Message: 1361

I can assure you that the Dale doing the tests mods and comments has NO INVOLVEMENT AT ALL WITH KIGHT RADIO.

Just making CERTAIN that EVERYONE on the group knows that , in case the Dale on this list that is posting on here currently is already off for the evening , is NOT confused with the other Dale !!!

This Dale does indeed own a business that also sells other ham products . He is the founder and designer behind the PAR antennas that are so popular and so highly praised , by hams all over the world in Ham Radio , especially the QRP field . The famous EFHW , etc . He has sold that part of his business .

His line of products that he manufactures may be found at the following URL :

Thanks for letting me know, Charlie , W5COV. These two Dales are definitely different people.

My sincere apologies to this Dale Parfitt, W4OP, for any confusion I may have caused. And Dale, I really love your end-fed half-wave antennas, I own two of them!

73 and best wishes,
de David, VK2DMH

I sent in my money as a pre-paid order back in May, and I have gotten to the point where I am not willing to wait any more.

Dale used to answer my emails, months ago, but the last answer I received from him (whan i said gimme me radio or refund my money!) just said "Are you receiving my emails?" and it said absolutely nothing else. It didn't say what was happening.

Since that time I have emailed a further 5 or so enquiries, and all of them have been ignored. So I now feel rather negatively towards KightRadio, since they have not handled the situation at all well, as far as I can see.

Is the Dale I have recently seen discussing this little transceiver the same Dale who once replied to me politely from KightRadio, or are they two different people?

I do know the factory has been very very slow in sending KightRadio the units they had ordered, but from what I have been reading in here for all these months, the radio still has so many things wrong with it I am not comfortable with the idea of trying to fix the thing when (or if) I ever get one.

So I want my money back, unless I know I will get one with all the fixes - such as the CW alignment - done properly by the factory.. Then again, I might well die of old age waiting.

What do you suggest, guys? And Dale, are you the guy I should be talking to or is that Dale somebody else? I have already paid KightRadio for the rig, so if they can't supply it, they ought to refund me. I am certainly not willing to pay twice for the radio.

Dale, (W4OP)

I also love your end-fedz antennas... I have the 10, 20, 40 meter version. Thanks for the great designs. I'm glad you are interested in the X1M!

Dale, I generated the RX SSB filter graph you suggested and posted it in the photos section. I rounded to the nearest dBm so it is a little bumpy...

I just un-boxed my X1M Platinum. I ran the TX into a dummy load and turned on my SoftRock Ensemble II SDR. There is enough RF despite the dummy load to register on the SDR, which is about 1 foot away. As you can see in the photos section, the sidebands of the X1M need some adjusting, The USB bleeds into the LSB and the LSB is weaker than the USB (all done at 7.280MHz). I'm sure this will be worked out in the adjustments I plan to perform. Also, the

bandwidth of the SSB signal is well shy of the standard 2.7kHz. I suspect this is a limitation of the mike, which I suspect is the weakest link in the X1M rig. Just for reference, I added a similar test using an ICOM 7000 running 5W output and a MST400 kit LSB 40M transceiver (www.ozQRP.com) I built. I alternated LSB and USB for the X1M and the ICOM. The MST is only LSB. I used a Diamond SX-200 meter set at 5W full scale to run all t hree transceivers at about 2W peak (by eyeball).

From: <orders@...>
Topic: 1304 Message: 1365

You can actually see the location of the SMD resistor for the original version in my photo I uploaded asking about the trimmers in the photo section. The IC that is only 1/2 in the photo on the bottom left is the LM386 and the SMD resistor below it is the R80C of note. On the original version the cap is mounted on the bottom of the top board but easily traceable from the top.

Charlie -- I'm glad to hear that at least two of the orginal rigs have the same resistor value and one of the Pro too. Gives me hope that while they didn't follow the schematics they at least were consistent!

-Chris
KC8MUS

ps - the photo of note is in the album ver II Specific Photos and the photo name is "20130907_201301"

--- In x1m_qrp-transceiver@yahoogroups.com, <cvest@...> wrote:

I modified the original version. The non pro version and it is easily done with just the top cover removed . There is plenty of room even if you don't do SMD work to make the change . All solder connections needed are in plain sight on top of the board . If anyone needs help I can describe it in more detail but it is the resistor right off of pin 1 in front of the notch on the LM386 .

BTW it is also a 1K resistor in the one I have .

Charlie , W5COV

On 9/9/2013 7:10 PM, Dale Parfitt wrote:

Hi Perrin,

I have the rig back together, but the resistor is directly under LM386 on the PRO version and can be IDed by confirming that one end goes to pin 1 and the other end goes to the electrolytic which is also on the underside of the top board. W5COV reports that the resistor is on the top of the orignal version board which makes the mod even simpler. With the extra gain, I seldom use the preamp now.

Thanks Dale,

If your rig still has it's covers off, would you be able to take a picture of the resistor location (R80C) and upload it to the group? I believe R80C can be accessed without separating the boards? This sounds like a very quick and simple mod to me!

Cheers,

Perrin

Hi Chris ,

Yes even the leads for the capacitor are easy to access on the original version . With the mod done , I can only barely crack the volume control pot above the "on" position to have plenty of speaker audio . I let it run all last night while I listened to CW on 40 meters . If a person wanted to keep it "factory looking" they could change the resistor out for a zero ohm jumper of the same physical size . I just didn't have any on hand . I am not even certain what "size" of SMD's are used in these radios , because I really do need to order some SMD parts to have on hand for making small clean and professional looking mods . I need to get me an assortment of different parts .

I'll verify the value in the Pro today . I am alternating back and forth between the two rigs . I am trying to verify and document a couple of other changes between the two versions hopefully later today . I believe there are some updates to the Pro in the on board power conditioning circuit , which may or may not be related to the issue to the unlock issue that some of the people with the original model have and do experience . I won't know for sure until I document the Pro version and get some voltage readings , on the parts that I suspect are the problem on the original .

THANKS for the photos !! A nice set of photos for the boards for both versions would be nice and perhaps someone good at things like that can even tag at least some of the part numbers , to help keep people oriented looking at the board and maybe specifically identify any parts that get a mod made to them .

It is great to see so many people working together to help everyone else , enjoy this little rig . I still just love the little rig and have made plenty of exciting QRP SSB contacts with it .

Sure would be even better if we can get someone from the factory that is at least pretty decent in English and Chinese to join this group . I am SURE that it would not only benefit we users , but could REALLY benefit the company too .

I am having the same problem Dale and also it takes hours at times for some of my posts to show up. Yahoo is changing their groups format and I suspect that is where the problem is .

I do NOT like the new format at all , especially from an administrator of a groups point of view .

I am seeing similar comments on other groups , so I think it is a Yahoo problem .

From: <orders@...>
Topic: 1193 Message: 1369
Attachments: 1 described; binary payloads are missing from this source WARC

Hi all,

I got the SSM2167 MSOP package installed onto a DIP via Proto-Advantage in the mail today. Super happy I had them do it and the final product is still nice and compact! I attached a photo of the tinyness of this IC. I'm going to start playing with it over the weekend probably.

Has anyone yet hooked up the mic from the x1m to a computer? I tried briefly and it didn't work. I haven't looked past my 30 second test but I'd like to hook it up to a spectrum program on the computer -- see its results then do the same via the compression cirucit and see what it looks like before I send it into the rig, etc. So if anyone has done that already or knows the trick off the top of their head -- please let me know!

Thanks,
-Chris

Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully

functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

I've had nothing to do with Kight Radio, but in their defence, the radio shortage/delay is a global thing (not just Kight Radio).
Ed from wouxun.us obviously placed a very large first order early on, hence how he currently has stock.

We have the same problem with supply of the X1M PRO here in Australia<http://sites.google.com/site/spooktechengineering/ham/qrp-hf>, where the factory had indicated shipment departure/delivery dates, but has since gone quiet.

In terms of 'issues' with the radios, most (if not all) of the known issues with the radio mentioned on this list have been passed on to the factory, so, by being patient and waiting till stock comes in to Kight Radio (or whoever else is waiting on stock to come in), you may end up with a new radio with a heap of fixes already done for you.

As they say, patience is a virtue! (I'm waiting too).

Thank you for your information, Heath. I appreciate it, but I after four months of being patient I have come to the point where enough is enough!

If Dale (or anyone else from KightRadio had had enough courtesy to reply to my last few emails, I may have been willing to wait a little bit longer. But nobody has bothered to reply.

I began by asking for either the radio or a refund. But now I just want the refund. That way I can wipe my hands of the whole frustrating experience.

How can anyone running a business fail to communicate with its distressed customers like that? I am not the only one. At the very least they could have posted regular updates on their site every week or two.

Hearing nothing back means I'm being ignored.

Heath ,

Since this order of the Pro's appears to have been completely shipped , do you think that there is a chance of getting a schematic of the Pro we have ? We know that one has to exist .

Every little scrap of paper we can get from them will help us and likely end up helping them also when we pass along changes or fixes that they can incorporate in either the batch they are now running , or a future batch.

I would hope they are just trying to resolve the current issues to get to the point that they have a stable version to go forward with , and not trying to add new features at the same time in this batch .

Any chance of you or someone else getting a better point of contact and or more contacts ?

1375. O/T: KN-920 dead in water

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-11 23:34:41 UTC
From: Fred VE3FAL
Topic: 1375 Message: 1375

As a few of you know I was and have been testing a KN-920, after getting some of the menus figured out and few other things I was starting to make qso's with it this week,

I actually had about a dozen SKCC qso's completed on bands from 15-80 meters between Monday and Tuesday morning.

I was running the KN-920 with a windom and running the rig at 10 w.

My windom on the bands specified is a 1.2:1 match for the cw portion of the bands, as well I have a tuner in line at all times and a meter.

Well during my last qso (RIP KN-920) yesterday morning the power supply and radio shut down, my son said Dad I smell heat, well the bottom of the radio where the finals are heatsinked was hot as heck and the smell and heat was coming from the radio.

I reset the power supply and radio and turns out I have ZERO for power output. Looks like the final or the drivers went POOF and let their magic smoke out.

So , I have made frugal attempts to also get schematics' and confer with the seller and builder to try and resolve this matter, well my emails are answered far and few between.

I was really hoping I could have had a real decent review on this unit but so far that has not happened.

See if I have to bite the bullet on this one and maybe change out the finals and see what we can do.

Sorry for the off topic mail but I know I have conversed with a few of you on this and a few of you also belong to the chinaradio group as well.

Fred

I'm thinking and inline version would be the most useful to start out -- plug the mic into the inline box and then have a tail from the board into the rig. There isn't any room in the rig to stick it easily and putting it directly into the mic would limit it to one circuit per mic... also not flexible. The other option is a larger block in the middle of the mic cable but that seems the wrong way. Anyone have any thoughts on a performed form factor for it? -Chris

Thanks for that Charlie,et al,

Tried it again and it didn't work...of course when I found out one of the solder connections in the 1/8" jack had come off from before... that very well would explain why it isn't work! Guess that will be next on the list: better reinforced mic jack.

Check!

I've built several homebrew versions of the TenTec accessory compressor-limiter. They seem to be quite effective at improving the punch of SSB and AM signals, and should be useful on the X1M transceivers. The design is the same as used in their high-end analog transceivers.

I've posted some info on my website...

Hello David,

I'm in the same boat as you, in regards to a wait. The last response from Dale was on August 20, saying the radios should've been in within a week or so. This was three weeks ago. The other day I sent an e-mail asking either for a definitive timeframe for the arrival of a radio, or a refund. I'm still waiting for a response.

Waiting for a product is not a problem. The question is, how long is too long to wait? Or, how many times can a schedule be pushed back? I don't want to be on here in December, still complaining about not getting a radio. Mid April was when I initially ordered, and mid May was when I received a DOA unit. Heck, a part of me wished I would've just kept and fixed that one. But no, it was on warranty.

Sadly, this whole experience has left me a bit frustrated and disappointed. The only blame I can put onto Dale is a lack of timely communication on the matter. The rest has to go toward the manufacturer. So I'm hoping to either see a radio soon, or get closure to this experience.

For the moment though, it's just wait and see.

Here is an interesting little electret microphone of a size and weight that matches the rig nicely. I see it as a starting point for including additional functionality (like compression) or just an idea for an easy-to-build form factor.

http://www.qrpkits.com/microphone.html

1384. X1M Stock arrived in Australia today

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-13 08:31:11 UTC
From: Heath - VK3TWO / VK6TWO
Topic: 1384 Message: 1384

Hello all,

A shipment arrived in Australia today, direct from the factory.

It appears that the new 'factory default' alignment settings are slightly different (Improved), though they still haven't quite got the firmware right yet. It appears that they've use the same firmware files a few of us have used from the files section to load the firmware. So what does this mean? well it means they have a serial number of XGFFFFFFFF, and no.7 in the alignment menu is 'a bit dicky'.

Firmware:
V1.00b USA
Jul 20 2013
16:18:40
SN:XGFFFFFFFF

New default values are as follows:

1. IF Offset: 08999850
2. LSB BFO: 08998850 (probably should be 8750)
3. USB BFO: 09000950
4. CW BFO: 08999850 (probably needs adjusting)
5. CW TONE: 0800
6. CW TDLY: 0300
7. KEY SPD: 020 (has an issue displaying this)
8. TXP TIM: 0000
9. BRITNES: 100
10. CNTRST: 100
11. FBND TX: 0
12.DDS CLK: 03276800
13. DDS MLT:1
14. RST ALL: 0

Yet again, I've fed back information to the factory re these issues.

Today my X1M Pro arrived.
Nice little rig. Will have to play a little with it this weekend.

Hi Andy and the group,

Mine is with a friend who is bringing it over for me. I should get it in the first week of october....
Possibly this will be the first one in England....but i do not know for sure....

Topic: 1391 Message: 1392

My Microphone has the resistor as 222 or 2200 ohms and a capacitor across the electret microphone element. Could you upload a higher resolution diagram. It is a little hard for my old eyes to read. Does you microphone use a 4k7 or 4700 ohm resistor? I have the X1M Pro model.

I have an HL-45B and it needs to be keyed by your rig, it isn't an RF-sense type amp. I actually joined the group to see if the X1M interface on the back had a PTT on the back that could be used for this. I suppose if push came to shove I could rig up a double-pole-single-throw switch as PTT in the mic, but there is no info on the X1M DB9 connector other than "this isn't normal serial" Is there any way to key the amp from the X1M without hacking up the mic/cable? I'd like to get one of these for an EMCOMM go-box with my HL-45, and it'd be nice.

I don't see why not. As I understand it, the "booster" amplifiers detect RF input and turn on, otherwise bypass the amplifier during receive. No actual experience, however.

Tokyo High Power makes one for the Yaesu FT-817ND. They say that it can be run "manually" for other low powered rigs.

http://www.tokyohypower.com/hl-45b.html

Around $500 or so. Frankly, for that sort of money, I would go for an Alicno DX-SR8. You can always use another radio...

Currently, my shack has the X1M, Yaesu FT-817ND, Alinco DX-SR-8, and for VHF/UHF, an Alinco DR-605. The three HF rigs are connected through a 4-way coax switch, SWR meter, and LDG Z-100Plus tuner to the antenna system. That 4th socket needs something attached to it....

Without looking at the schematic, I don't know the answer. But if there is not, you can build a COR for under $5.

None here Andy. The way it is set up gives the chip a gain of 50. Shorting across the resistor gives it a gain of 200.
Check out the data on sheet 5 here. http://www.ti.com/lit/ds/symlink/lm386.pdf There is no reason for it to cause problems.

No problems here with either X1M version . Makes one heck of a
difference on speaker volume . I can just barely crack the control above
turning the radio on and have a pleasant listening level .

Lee I am not quite sure if this is the question that you are asking , but maybe a little note that will help someone else that hasn't seen the values expressed like this . A 4700 ohm resistor and a 4K7 resistor are the same value , just a different method of notation not normally used in the USA . It means it is a 4.7 K resistor . Actually a pretty decent system for listing values overall .

No there are no "dry contacts" available that I am aware of for switching an amplifier . There certainly are no connectors on it for that purpose .
The DB-9 plug is used to update the firmware and to interface with a computer for control with HRD or similar program . The "this isn't normal serial" reference refers to that it is TTL so it requires a TTL level converter . Ed has them listed on his site . They are very small using a SMD in the cable plug , and work quite well .

What I was saying was that no matter what terminology is used that mine was a 2200 ohm and his was a 4700 ohm. Different resistors in our microphones.

Lee I am not quite sure if this is the question that you are asking , but maybe a little note that will help someone else that hasn't seen the values expressed like this . A 4700 ohm resistor and a 4K7 resistor are the same value , just a different method of notation not normally used in the USA . It means it is a 4.7 K resistor . Actually a pretty decent system for listing values overall .

Charlie , W5COV

Same version as mine. Resistor is on the bottom and I jumped it from pin 1 to the + side of the capacitor as shown.

No there are no "dry contacts" available that I am aware of for switching an amplifier . There certainly are no connectors on it for that purpose .
The DB-9 plug is used to update the firmware and to interface with a computer for control with HRD or similar program . The "this isn't normal serial" reference refers to that it is TTL so it requires a TTL level converter . Ed has them listed on his site . They are very small using a SMD in the cable plug , and work quite well . www.importcommunications.com

On the PRO, it is underneath the LM386. Use a VOM to make sure you have the right resistor-1K. I soldered a tiny short across it w/o separating the boards.

Yep that is what I figured they would do. Just a single general purpose transistor and they could be in business .

I have been "reserving" my spare pins in case I want to add or switch a different accessory. You know me it will likely be something at MF or LF :)

Sorry I misunderstood your comment Lee. I have noticed that there is not one single "standard" microphone shipped with the X1M . From watching and reading the list here , I know of at least two different ones , that even use different colors for connection on the mic plug .

Possibly and likely two completely different mics being commented on . I don't know how many different mics are out there for the X1M , so maybe people should also include in their notes how their particular mic plug is wired when they are first setting the radio up .

The wires are a known stress point and Paul has a very good suggestion of filling the plug with RTV .

Sorry for the misunderstanding .

Date: 2013-09-16 20:29:23 UTC
From: Lee
Topic: 1391 Message: 1415

Is it the new yahoo format or is this weird. I have the group individual emails sent to my home email address. This one from Charlie came twice. The second one had one blank line at the top. It only happens once in a while and not just with Charlie. It was only posted once online. Does anyone else have this happening?

Subject: Re: [X1M_QRP-Transceiver] X1M microphone diagram.

Sorry I misunderstood your comment Lee. I have noticed that there is not one single "standard" microphone shipped with the X1M . From watching and reading the list here , I know of at least two different ones , that even use different colors for connection on the mic plug .

Possibly and likely two completely different mics being commented on . I don't know how many different mics are out there for the X1M , so maybe people should also include in their notes how their particular mic plug is wired when they are first setting the radio up .

The wires are a known stress point and Paul has a very good suggestion of filling the plug with RTV .

Sorry for the misunderstanding .

Lee I am not quite sure if this is the question that you are asking , but maybe a little note that will help someone else that hasn't seen the values expressed like this . A 4700 ohm resistor and a 4K7 resistor are the same value , just a different method of notation not normally used in the USA .

It means it is a 4.7 K resistor . Actually a pretty decent system for listing values overall .

1419. RE: External amp keying

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-16 21:40:49 UTC
From: <orders@...>
Topic: 958 Message: 1419

Looking at the schematics for both the original and the PRO version of the x1m it looks like there aren't many spare pins on the db9 - in fact only 1. Well let me rephrase that -- completely empty pins. The other 5 go to relays that switch the LPF. There is only 1 pin that is unassigned. The other 5 would have to be 'disconnected' before using. I don't think the 5 relay pins will help with the PTT question exactly but if they do...run with it!

Also there doesn't appear to be a PTT line in the serial command set it is responding to so I don't think using that wll work either.

No there are no "dry contacts" available that I am aware of for switching an amplifier . There certainly are no connectors on it for that purpose .
The DB-9 plug is used to update the firmware and to interface with a computer for control with HRD or similar program . The "this isn't normal serial" reference refers to that it is TTL so it requires a TTL level converter . Ed has them listed on his site . They are very small using a SMD in the cable plug , and work quite well . www.importcommunications.com (http://www.importcommunications.com)

So word from the factory is that it looks like the finals blew in my KN-920 of which I had already pretty much figured out. Problem is I do not want to open it up and snoop around in fear of no return or refund, and shipping it back is not affordable at all.

So I did get an email saying the KNQ10 board is same as final board section in the KN-920..

Can anyone verify for me just what transistors are used in this unit?

The KNQ10 is a 5 watt rig is it not, so if this KN-920 is 10w and adjustable to 20 w what transistors are indeed in it.

FWIIW, I have found it good practice to fill ANY connector with RTV silicon rubber. Picked up the trick when I used to work for RCA Sarnoff Labs when we were working with 20 KV TV stuff.

If you have to take something apart, an Exacto knife works fine.

DON;'T pot things up until you are sure the connector is properly wired!

I also use the "hot glue gun" to secure torids. That stuff is polyethylene plastic, so is a good insulator. That stuff is quite a bit more difficult to get apart after the fact, but again, an Exacto knife works pretty well.

Hi all,

Sorry for the late reply on this topic - I have been tied up with work...

I have performed the modification and I highly recommend it. The rig is much nicer to use now, and weak signals can actually be heard with enough volume.

Thanks Ray, KD4HJT for emailing the pictures. I have uploaded these to the modifications folder as I could not find them anywhere else in the files section.

I also tweaked the mic gain while I was there, setting it just a little less than full has worked great for me. I am getting lots of positive audio reports, and I notice the power meter peaking higher than it was before. RX and TX improvements done in minutes. Great stuff! :)

Cheers,

Perrin VK3XPT

Thanks for feedback, Perrin. Will try the modification today after getting home from work. Regarding mic gain I changed it to over 90 degrees clockwise and got more output too on my old CB power meter. After that I had a qso with an Ukranian station wo told me that my modulation was nice :)

Hi All,

Been lurking here for a couple of weeks. I own the Pro addition. I have adjusted the mike as has been suggested. Still not much power going out from the rig. Guess, according to some others, I may have to tweek it more than 90 degrees clockwise. As far as this RX mod is concerned, could someone possibly put up a video of it being done or, one that has already been done, pointing out the highlites of doing it? That would clear up a few questions for a noob in the electronics world. Anyway, thanks to all for you work!

Bill

On mine, if you turn the mike gain pot too far, the gain drops. There is a sweet spot that ca be found by providing a steady input to the mike (some people just say "ahhhhhhhhhhhhh") and turning the pot while looking at a meter.

The power you see on a regular power meter will be average power and not peak power , so you can't always go by the power meter , especially on SSB .You can still use CW "M" to measure your power , it just won't have any microphone deflection .

The mic control needs to be rotated or rocked to find the correct spot . It is not going to always be the same 45 degrees or 90 degrees for each individual radio .

I don't know anything about putting up a video , but the mod for the audio is quite simple and I "think" we can talk you through it since the mod and the area are easy to do and find .You do need to have some good soldering skills and use plenty of magnification and light if you have vision problems like I do .

Feel free to e-mail me off list if you need more detailed help making the mod and I will try to help you .

Hi Bill,
The additonal gain mod is nothing more than shorting out resistor R80C underneath LM386 IC. A video won't really do anything. Just locate the resistor and put a jumper either across it or from pin 1 of the LM386 to the (+) side of C155C.
Look at the schematic- couldn't be easier. The net gain is +12dB.
As far as SSB power out- do you have a peak reading wattmeter? With an Average reading meter, you are not likely to see much power.

Hello,

I received my new X1MPRO on the last Saturday of WIMO (Germany).

Ver: X1MPRO V1.00b USA
Date: Jul 20 2013
Time: 16:18:40
SN: XGFFFFFFFF

The device is a typical Phone TRX.
The RIG plays very well on SSB. Have tested this in the WAE contest.

For me as a cw op following is unsatisfactory.
- the built-in CW keyer is scrap - the dashes are too short.
- in CW mode SPLIT-operation does not work.

I hope for an improved firmware upgrade.

I have been very busy here, but now that we have sufficient system gain, I have laid out an AGC circuit that should be easy to implement. Once finalized, I'll make up 30 or so SMD boards- about half the size of a postage stamp. Only 4 connections- +12, GND, AF in and AGC control voltage to the MC1350.
So let's hope the ckt performs as expected.

Hi Dale (W4OP),

As you seem to have a good understanding of the X1M-PRO audio stage, I am wondering if you have any ideas as to what causes the high volume "clipping" that occurs?

At times I would like to run the X1M-PRO at slightly higher volumes (even with the great R80C modification), but doing so results in the clipping problem. I am wondering / hoping for a simple fix to this problem.

Do you have any ideas?

Thanks in advance,

Perrin VK3XPT

Hi Albert,
The 1350 is a bit old at this point but is still an excellent IF amp and has a wonderful AGC control. The fantastic RX in the Elecraft K2 uses this exact IC. Because it is post filtering, IM is not an issue and from memory, it can accept about 3V P-P without distorting. It's AGC control is just not being used (yet) in the XM-1. It has a fixed DC bias on it. My circuit (should it function as designed) will take advantage of the IC's AGC.

Hi Perrin,
I have not experienced that here. Of course, the little speaker distorts at high levels, but I have never experienced clipping.
Make certain your power supply is capable of handling the current peaks and that the coaxial power plug you are using is the proper diameter. If you have a scope you can look at the input to the 386 and output to see if the clipping is occurring there- I think it unlikely though.
Anyone else have clipping (as opposed to simple distortion) at high levels?

Hi Dale,
Proper AGC control to the receiver is very important, that's the reason I am also concern the MC1350 in this rig. I got my X1M pro on 18/7 directly from BG8HT, tried a few local and a QSO to BV, found too low the receiving audio and lack of agc control to handle strong and weak signal. I did the mod for RX audio gain today and the result is positive but I think I will replace the resistor with smaller value to lower a bit the audio gain. The RX band pass is no way to adjust, I need to fine tune the 20m section! Any idea?

Hi Dale, very much interest in your AGC project. The original MC1350 circuit in it is too simple and need to be improved. 73

☐
I have been very busy here, but now that we have sufficient system gain, I have laid out an AGC circuit that should be easy to implement. Once finalized, I'll make up 30 or so SMD boards- about half the size of a postage stamp. Only 4 connections- +12, GND, AF in and AGC control voltage to the MC1350.

So let's hope the ckt performs as expected.

Hi Dale,

Thanks for the reply. I have confirmed that my power supply and connections are not the culprit here. I have a scope so checking the input is a good idea - I just need to find some spare time to get this done!

Here is an old video I took that was demonstrating the low volume of my X1M-PRO: http://youtu.be/0apKc2kc8GE . You will notice the clipping occurring in this video, although it is not a great example of the clipping problem or how bad it can get (let me know if you would like me to take a new video showing the clipping more clearly.) I am sure this is not simply the speaker distorting as the same audio clipping is heard when using external speakers / headphones.

The R80C mod has made my radio louder, however clipping occurs from around the 12o'clock position now (overall the radio is better, but the clipping remains an issue for me).

I have asked the group about this previously but I had mixed replies on the issue, so I am tending to think not all X1M-PRO's are affected.

Cheers,

Perrin

Hi Albert,

As before, the MC1350 has excellent AGC characteristics- I am not sure there is even a better choice. The issue currently with the XM-1 is that the AGC pin is not being used in the 1350.

You'll have to expand on what you mean by fine tuning the 20M section. I don't understand what you are referring to.

Hi Dale,

Proper AGC control to the receiver is very important, that's the reason I am also concern the MC1350 in this rig. I got my X1M pro on 18/7 directly from BG8HT, tried a few local and a QSO to BV, found too low the receiving audio and lack of agc control to handle strong and weak signal. I did the mod for RX audio gain today and the result is positive but I think I will replace the resistor with smaller value to lower a bit the audio gain. The RX band pass is no way to adjust, I need to fine tune the 20m section! Any idea?

☐
Hi Albert,
The 1350 is a bit old at this point but is still an excellent IF amp and has a wonderful AGC control. The fantastic RX in the Elecraft K2 uses this exact IC. Because it is post filtering, IM is not an issue and from memory, it can accept about 3V P-P without distorting. It's AGC control is just not being used (yet) in the XM-1. It has a fixed DC bias on it. My circuit (should it function as designed) will take advantage of the IC's AGC.

Hi Dale,

This is the matter for I concerned the MC1350 ic's AGC pin is not being used.

The 20m RX filter circuit of my X1M pro is not tuned correctly, sensitivity is significantly decrease from 14.160 up, If I want to fine tune the section, I cannot tune the coils directly in circuit with the radio turned on.

Topic: 1304 Message: 1449

Hi Albert,
My XM-1 is currently in the cabinet so I cannot make definitive measurements, but using my signal generator in an MDS test, I would estimate the loss of the 20M filter to be less than 4dB at the top end of 20M. Try this test- connect a 20M antenna and with the preamp on, tune the XM-1 from 14.349 (while listening to background noise) to 14351. The internal filter will be bypassed above14350 and you should notice a slight increase in background noise. You should also hear the 20M LPF relays click. Let us know how this test comes out. If you have a large increase in background when the filter is bypassed, I would suspect an icorrect/defective component in the 20M LPF or relays K5A or K11A- both are involved in selecting/deselecting the 20M LPF. Simple VOM tests should prove the relays out.

1461. X1M Keyer

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-18 23:01:05 UTC
From: Dale Parfitt
Topic: 1461 Message: 1461

I have just completed looking at the keyer in the XM-1.
I set the speed at 25wpm for convenience.

DOTS= 25mSec
DASHES= 75MSec

So far so good as theoretically a dash= 3XDot

Dot spaces= 74MSec
Dash Spaces=74MSec

In theory a the space between successive dots (element spacing) = 1DOT length and the same for Dashes.

So Dash spaces are 3X longer than they should be and dot spaces are also 3X longer than they should be.

The spacing between characters is 5XDot- some like this feature, others do not.

Some variance is OK -known as weighting, but w/o that feature, the keyer should be spot on as to the dot and dash length and element spacing.

If this data reaches the designers, please also ask them to add dot and dash memory. The coding is simple and makes the keyer so much more usable.

Great Kent,
My other mod could add another 8-10dB of audio gain but the +12dB seems to be spot on and is a lot easier to implement than the higher gain mod.

Subject: [X1M_QRP-Transceiver] Re: Increased RX Gain

Just did the Rx gain mod to mine as well....huge difference...makes the rig so much easier to listen to!

I am noticing No artifacts or clipping in the audio except for the distortion from the tiny speaker at high audio levels ..which I totally understand!

Thanks Dale and company!!

73 to all de Kent

Ingo , we ALL agree with you . You will also find other CW issues , see later post by Dale , W4OP , regarding this , PLUS the radio transmits and receives on the same frequency in CW , so you can't work CW with it.

The RIT moves the transmitter and receiver both at the same time .

The attenuator function is enabled on the display , but the hardware is not enabled .

We need to generate a complete list for the files section and I now have a bit of a contact in China , which I will try to get the information explained to in detail , along with some suggestions to resolve the issues .

Be sure to also look at the LM-386 audio mod that Dale , W4OP , also posted . It is very worthwhile . Dale is also currently working on an AGC add on as the current MC1350 is being run wide open and not being fed any voltage for true AGC control , just a fixed voltage .

Most of them need to have the microphone gain and sidetone levels adjusted to suit yourself and to get maximum SSB power without splatter . Also the LSB BFO is normally in need of menu driven adjustment as they are being shipped from the factory .

I am now digging in , along with Dale , into the filter stage . Hopefully we will have a more optimized design , naturally our primary focus will be on the USA band segments .

There is a MAJOR difference in the procedure it will take to do any required modifications in the filter section between the original X1M version and the current version we are aware of here , the Pro version .

PLEASE send your feedback to your dealer/wholesaler and inquire if he has ANY direct contact with the factory . We HAVE to be able to establish reliable two way communications with the factory and the users , so the more users that get a message back to the factory , the better !!!

If ANYONE has DIRECT contact with the factory engineering department , we would love to have the opportunity to work with them to resolve these and possibly other issues , that I have missed .

We even have people willing to help resolve the software issues so the company can issue a firmware update , however we have no way to access the software , even an early version , would prove very beneficial to both the user and the factory .

If there is anyone from the factory engineering department , they can feel free to contact me directly by e-mail at w5cov@... , and I can ASSURE them that the information will be put into competent hands

here in the USA willing to work with them .

Feel free to share this e-mail with ANY other person or group , that might be able to help us bring this little rig up to specs .

Best 73 , Charlie , W5COV

Hello,

I received my new X1MPRO on the last Saturday of WIMO (Germany).

Ver: X1MPRO V1.00b USA
Date: Jul 20 2013
Time: 16:18:40
SN: XGFFFFFFFF

The device is a typical Phone TRX.
The RIG plays very well on SSB. Have tested this in the WAE contest.

For me as a cw op following is unsatisfactory.
- the built-in CW keyer is scrap - the dashes are too short.
- in CW mode SPLIT-operation does not work.

I hope for an improved firmware upgrade.

Hi Charlie,

I bought a couple of units of the X1M from a local supplier here whom from time to time he imports nice radios from China and USA..One works well on SSB n the other "kaput" after a few hours of casual use. A quick inspection shows a broken antenna connection at the back of the radio. I thought it would be an easy fix by resoldering the coaxial centre lead back to the antenna jack (amazingly louzy solder work from the factory!!). After resoldering, the RX is back to normal but zero on TX on all modes.. When u "rock" the chasis a little, u get some TX but intermittent. Somewhere out there sits a loose connection..a major headache!! My friend who imported them have tried to contact the vendor but so far no reply from him.

Anyway, I have a friend living in Shanghai and see if he could try to get in touch with the factory in Chong Qing province in North China. On my last trip to Shanghai a few weeks ago, I have also met Adam Rong of the KN - series for an eyeball meeting and apparently he was not too keen with this radio as the earlier versions have many problems.

Being a third generation Chinese living in Jakarta, Indonesia, I speak very limited Mandarin but lets see if my friend in Shanghai could help..

Many thanks for letting me in to the Group.

Cheers and 73 from
JOY/ YB0NSI.

iPhone is Cool !

Hi Chris ,

On the original X1M , the toroids and COG/NP0 capacitors are all mounted on the top side of the bottom board , inside of the larger of the two metal shields . They use true ceramic style capacitors radial leaded components.

On the Pro version , they have only the toroids mounted in that "box" on the top side of the board . You have to completely remove the lower board from the case and the capacitors are mounted on the bottom side of the board . All of the capacitors on the Pro for the LPF are surface mount .

Right now I am working on documenting the core dimensions , plus the number of turns for each toroid . Haven't seen an inductance value or a core type specified anywhere , so still trying to get better information for Dale to run some plots and simulations with , to see how the filters actually are characterized across the intended band .

The Pro board seems to have decent lettering on the board to be able to get the part number of each particular capacitor and then being able to reference them to the schematic in the files for the value .

Dale is pretty darned busy with his regular business , so he only has a limited amount of time to devote to analysis of the X1M .

I am going to try and get decent pictures of the top and bottom of all of the boards for the original and the Pro and then try to label as many parts as possible so it is easier to stay oriented as to where you are when looking at the boards .

Hi Joy ,

Nice to meet you and FANTASTIC to have you in the group !!! Perhaps you can get us some help , exchanging information with the factory and we are certainly willing to help you resolve any issues that we have enough information on to help you .

I just met Adam yesterday through e-mail in my quest to get to the engineers at the factory for the X1M . He was very kind in providing me with at least e-mail contact information . Adam is very responsive to his group of users and products . Something we have never seen from the X1M factory .

We do have people that are both willing and capable of identifying the issues and offering advice on making changes to make the radio perform as specified .

On your problem we have had similar issues and they usually trace to a faulty connection at one of the pins and plugs . One item that deserves a close look is the connector that joins the top and bottom boards . That is a particularly bad plug place . I have two different X1M's here , what we call the original with the red button and small display and the Pro model with blue buttons and nice bigger display .

I have found that the little plug that is hard to see that joins the two boards , is a very loose fit and I spread the pins a bit to make a more solid connection , plus on my Pro version the male joiner has fewer pins than the female socket on the lower board . So when I take them apart and put them back together I always take extra time to line that up with the right set of holes and to also make sure it does go into the socket , because it is in just such a place it is hard to see and may not get plugged in , so use plenty of light and look at that particular "cable" joiner very well from different angles . Others have had a problem like yours and theirs was the front display board not getting pushed far enough back.

We could REALLY use a firmware update , since on CW our radios both transmit and receive on the same frequency and the VFO split not working in CW , we can't even "trick" the radio into operating CW , so we have no use at all of the CW mode .

Welcome and we look forward to making an X1M to X1M contact one day soon .

73 , Charlie , W5COV

1468. X1M 40M LPF

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-19 05:06:13 UTC
From: Dale Parfitt
Topic: 1468 Message: 1468
Attachments: 1 described; binary payloads are missing from this source WARC

I modeled the 40M filter using Agilent's Genesys software. Until Charlie gets me toroid type, size and # of Turns, I assumed an inductor Q of 200 for the first pass. Pretty typical for type 2 and type 6 materials.
I am attaching a .PDF of the filter response with a single marker. If Yahoo rejects the .PDF, I'll put the plot in the Files section on Thursday.

Hi Charlie and the group,

My Platinum edition should arrive next weekend when I meet up with Paul AK1C. Apart from WIMO, who have no stock I believe, I know of no other stockist in the EU (Europe).

If it is useful to the group I am quite happy to take high resolution pictures of the radio and it's insides and post them. Also I have a VNWA and can build copies of the LPFs and test them and post the plots. As I understand it there are no LPFs for the WARC bands so I can make some for them and test also. I'll hope to pass the radio to my good friends Jan G0BBL and Alan M0PUB at some stage who have access to sophisticated test equipment to measure it's performance "out of the box"

Is there such a thing as a complete list of "snags" with the radio?

73s from a cold and rainy England,

Steve G0XAR

Hi all,

So my clipping problem seems to be an *actual* problem with my radio. :(

Here is a new video of my clipping problem:

http://youtu.be/udIN5-81J-0

Dale (or anyone else who may be able to help me): I put the radio on the work bench and set the radio on 7090 LSB. I injected RF with a 1KHz tone and set about looking around the LM386 with the CRO. I am seeing the audio start to clip on both the input (Pin 3) and output pin (Pin 5) of the LM386 (It almost looks like DC is appearing during the clipping, but my CRO is a crappy old 20Mhz unit which doesn't tell me much - it's just my 'observation'). At the volume pot, the audio clips the same way, both on the fixed input pin and the variable output, once the pot is turned up enough for the problem to start occurring.

Some observations around the LM386:

Pin 6 (Vs) = 8.8VDC
Pin 7 (Bypass) = around 4.4V DC, and sees some AC (sinewave-ish) activity when the clipping occurs.

Does anyone have some ideas for me? Do the measurements I have made seen / voltages seem OK? If so, where should I look next?

Thanks in advance guys,

Perrin VK3XPT

I have been very busy here, but now that we have sufficient system gain, I have laid out an AGC circuit that should be easy to implement. Once finalized, I'll make up 30 or so SMD boards- about half the size of a postage stamp. Only 4 connections- +12, GND, AF in and AGC control voltage to the MC1350.
So let's hope the ckt performs as expected.

1476. XM-1 Audio break up

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-19 16:16:07 UTC
From: Dale Parfitt
Topic: 1476 Message: 1476

Hi Perrin,
Quite odd. I did not think it was the LM386 per se, but it might have to do with the +9VDC regulated voltage being drawn by the IC
With the same modulated RF signal in and the AF Gain up sufficiently to cause the audio breakup, look at the input and output of U1A (7805) and the in/out of U2A (7809). These points are not easily accessed, so look at the +9 and +5 precision voltages where they are distributed on the top board. eg +9 is available on pin 6 of the LM386. U1A is near the edge of the bottom board and you should be able to get a probe on its output. The +5 is derived from the +9 regulator. There's more to check but let's start there.

1478. X1M for sale

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-19 18:05:38 UTC
From: sbjohnston@...
Topic: 1478 Message: 1478

FOR SALE -

X1M transceiver purchased by me at the Dayton show this spring. Shortly after purchase I successfully adjusted the frequencies of the various offsets to get the radio operating correctly on both sidebands, and have adjusted the CW sidetone and mic levels for good performance. I also added access holes in the case for these adjustments so future operators will not need to open the case to make changes. These access ports were made using the same technique as the other holes in the case - they look nice.

I've made numerous contacts on both CW and SSB with this rig - after my adjustments it works as specified. Why sell it? It bothers me that the transmit bandpass filters kick out on the high end of 80 and 40 meters. But this is probably not an issue for many other users.

X1M transceiver tuned and ready to use - $290 postpaid to the continental USA.

Contact me at sbjohnston@... if you'd like to buy this rig.

Thanks Dale,

I will do this over the weekend and I will report back. I know that the +9v point, pin 6 on the LM386 remains constant at around +8.8v and does not seem to change when the clipping / audio break up occurs... (Is 8.8v typical and acceptable? I am guessing +8.8 is OK.)

I really appreciate your help, especially with how busy you are on other commitments/projects! (As a side note, an EF-10-20-40 and an FX-4 are on my Christmas list.. That is another thread all together though!)

1483. Question about DB9 and LPF connections

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-20 19:20:56 UTC
From: <neilgoldstein@...>
Topic: 1483 Message: 1483

I've seen in the schematics, and heard talk in the group that refer to some of the pins of the DB9 connector being linked to the LPF/BPF filter relays. I have one of the original models, and I'm wondering how I would use this to manually trigger the relays. Do the various pins need to be shorted to ground, or do they need voltage applied to trigger the relays, and if so, ho much?. I would love to be able to manually trigger the 40M and 75M relays to extend the filtered coverage to the USA band limits.

Well the coils are 5 VDC and contacts shown normally open for bands not in use . So you would have to select both relays for ONLY the band that you wanted to use . You can see all of the details on a single schematic page dedicated to that section. Looks like the 5 volts is always on the relays . Relays will need to be energized for your band of choice.

It is the TX Filter drawing .

The schematic is in the files section .

My eyesight is very poor so you might have a look yourself and have someone else verify this .

From: Dale Parfitt
Topic: 1483 Message: 1485

You can see the LPF to DB9 connections on the schematic page. The relays have +5 on them- by grounding the other end through the DB9 you energize different relays. I have not studied this at all- but am not sure how you would deselect the relay that the micro is connecting for a given band through software..

This is not the proper solution anyway. The answer is to redesign the 80 and 40M filters so that they properly pass the upper portions of 40 and 80M.

1488. RE: [X1M_QRP-Transceiver] RE: Audio Compression 'Accessory Circuit' Idea to Increase SSB Output

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-21 15:48:00 UTC
From: Lee
Topic: 1193 Message: 1488

I am working one also. I soldered it to the carrier board, lots of fun for old eyes, and have a test board almost done. I have to put the input capacitor on but I have been busy with other stuff. I put 2 potentiometers for the compression and threshold adjustments. They will be replaced with fixed resistors after experimentation. I hope Monday I will feed it with a 1khz 50mv signal to play with the compression settings and then reduce to 10mv to play with the threshold settings while watching on my pocket oscilloscope. After that I'll plug in a microphone watch it output and tweak if necessary. I really do not know what I am doing here but I've been having fun reading and soldering.

I bit the bullet and ordered a ssm2167 on a breakout board from them. I decided against soiling my playing with bad soldering fruseration for the moment and instead will forgo the extra coffee one day. I'm thinking and inline version would be the most useful to start out -- plug the mic into the inline box and then have a tail from the board into the rig. There isn't any room in the rig to stick it easily and putting it directly into the mic would limit it to one circuit per mic... also not flexible. The other option is a larger block in the middle of the mic cable but that seems the wrong way.

Anyone have any thoughts on a performed form factor for it?

Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip:

http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

For those of you that might be interested in building external filter banks, power amps, transverters, tuners, power supplies etc, you may buy the identical black extruded cabinet on eBay- item # 370645750442

These cabinets are a bit shorter, but likely the seller can chop them to your length.

Have fun,

From: <parinc1@...>
Topic: 1483 Message: 1490

I just checked the power out across 40M and 80M in CW mode (using my spectrum analyzer) and find it to be within 0.1dB. This is the PRO version.
This is excellent. In fact 80M was even less than 0.1dB

W5COV: I recall your LPF toroid turns counts were the same for all bands except 15M when comparing the X1M to the PRO Version. Have you been able to confirm the C values in the LPF's are also identical?

The poster who commented on Po rolloff on the upper end of 80 and 40- can you detail your measurement methods and rig version/

Tnx,

Dale W4OP

--- In x1m_qrp-transceiver@yahoogroups.com, <parinc1@...> wrote:

☐
You can see the LPF to DB9 connections on the schematic page. The relays have +5 on them- by grounding the other end through the DB9 you energize different relays. I have not studied this at all- but am not sure how you would deselect the relay that the micro is connecting for a given band through software..

This is not the proper solution anyway. The answer is to redesign the 80 and 40M filters so that they properly pass the upper portions of 40 and 80M.

Subject: [X1M_QRP-Transceiver] Question about DB9 and LPF connections

I've seen in the schematics, and heard talk in the group that refer to some of the pins of the DB9 connector being linked to the LPF/BPF filter relays. I have one of the original models, and I'm wondering how I would use this to manually trigger the relays. Do the various pins need to be shorted to ground, or do they need voltage applied to trigger the relays, and if so, ho much?. I would love to be able to manually trigger the 40M and 75M relays to extend the filtered coverage to the USA band limits.

No I haven't Dale . The X1M I will do tonight and the Pro is a bit more difficult since they are SMT .Suggestions on measuring them would be appreciated hopefully short of unsoldering and soldering them back which I can and will do if it will help everyone . I just prefer a simpler approach .<grin>

Those results aren't going to get any more linear than that !! You are right that is excellent !!

Thanks Charlie,
Let's hold off until we hear from the fellow who was having issues on the upper ends of 80 and 40M.
The power out by the way was 5.6W on CW. My bench supply is set at 13.0VDC.

Hello,

I an a newbie to this group, to HF operation and to owning an X1M.

As a "grey nomad" I purchased the X1M to take on the road in our caravan, and have just completed making a vertical antenna with a collapsible 10m Squid pole

I have a question I hope someone on the group can answer...

I have a 9 pin to USB lead. The only marking on it is "HL 340". Does anyone know if this is suitable to use with the X1M and HRD? (i.e. is it TTL and not RS232) I don't really know the difference, however I'm told it must be TTL for the X1M.
Is there a way to test? e.g. voltage pin out config etc?
Regards,
Ian (VK3YIC)

I am assuming that unless it is something that you built yourself , it is one of the commonly available adapters and will NOT work without the TTL interface for the X1M . You can see them at www.importcommunications.com

It is not something that you have to have immediately so you can order one . You will hopefully need it at some point to upgrade the firmware and it is also required if you plan to do partial rig control from the Ham Radio Deluxe , software .

Not a newbie to Google Lee, but all I could seem to see were drivers for the HL340…nothing definitive to say it was rs232. I also thought it was worth asking the question as there might be some adaptor available that people with more knowledge than I may know about.

Regards,

Ian Coots

I just googled HL 340 for you and it is a RS232 and will not work. You need TTL level. Are you a newbie to Google too?

Hello,

I an a newbie to this group, to HF operation and to owning an X1M.

As a "grey nomad" I purchased the X1M to take on the road in our caravan, and have just completed making a vertical antenna with a collapsible 10m Squid pole

I have a question I hope someone on the group can answer...

I have a 9 pin to USB lead. The only marking on it is "HL 340". Does anyone know if this is suitable to use with the X1M and HRD? (i.e. is it TTL and not RS232) I don't really know the difference, however I'm told it must be TTL for the X1M.

Is there a way to test? e.g. voltage pin out config etc?

Regards,

Ian (VK3YIC)

1497. Re: XM-1 Audio break up

Yahoo group: X1M_QRP-Transceiver (2013)

From: pezcat19
Topic: 1476 Message: 1497

Hi Dale,

I managed to have another look at my X1M-PRO and here are the findings:

The regulator output pins for the 9V and 5V regs are +8.85V, and +5.04V respectively. There is no noticeable change in voltage when the radio goes into Audio "breakup".

Apart from the 9V regulator being 'slightly' low, I have not seen anything that jumps out at me yet.

Here are 2 things I have noticed:

- There is +4.43V DC on the LM386 output pin. Is this normal?

- When I touch my multimeter probe on either Pin 1, 2 or 5 of the LM386 I hear AM BC stations. :)

I am not sure what to try / do / check next. Any further advice that you, or anyone else on the group can give me would be greatly appreciated.

73, Perrin

PS- I just ordered an EFT-10/20/40 Trail Friendly. I'm looking forward to using this one!

breakup, look at the input and output of U1A (7805) and the in/out of U2A (7809). These points are not easily accessed, so look at the +9 and +5 precision voltages where they are distributed on the top board. eg +9 is available on pin 6 of the LM386. U1A is near the edge of the bottom board and you should be able to get a probe on its output. The +5 is derived from the +9 regulator. There's more to check but let's start there.

Here is the pin out I used for this TTL cable

Pin 2 of DB9 to USB TTL Adapter TXD White wire

Pin 3 of DB9 to USB TTL Adapter RXD Green Wire

Pin 5 of DB9 to USB TTL Adapter GND Black Wire

Red Wire not used. The wire colors might be different on various USB TTL Adapters.

Dale can you believe this didn't arrive until a time stamp of 9:30 this morning ?? Yahoo is still really messed up . I like the idea of running the radio at 13.0 VDC and seeing those numbers . Lower voltage might be interesting .

I think perhaps the early model might benefit from running on a lower voltage , but I haven't taken power supply verses output power readings yet .

With everyone's input like yours and Perrin's numbers , and any posted by anyone else , we can start putting together quite a tech / BASIC service manual on this rig .

We do need to hear about the low output again om 80 and 40 to see if that was an early model , since I / we can verify the toroids and windings , plus capacitors , and perhaps help him correct the filters .

LOL Maybe that is why I am an old bachelor . My two dogs don't seem to complain at all and I am a true night person so I am not normally even on the net this early in the morning .

I work DX , various digital modes , the part 15 bands , and I am working on a new part 5 license , where the bands are night time bands , plus I have always enjoyed the peace and quiet of the wee morning hours .

If the bands aren't open I ALWAYS have at least one project on the bench that I am building and usually several at the same time .

However since I went to computer logging , I have gone back to using headsets , so my hands are pretty much free to type when I am on phone . One day I may need to add VOX to the X1M . Right now I have a momentary push button in a film can type plastic container to activate the PTT , until I decide what I want to put in a mic interface box for this little gem or see if I can possibly work with smaller SMT devices and squeeze something inside of it. I can go smaller but 1206 are the smallest I am really at ease with and they are fast disappearing from the market .

It is quite remarkable what you can do with 5 watts if the conditions are right. What band? What time of day?

From: Dale Parfitt
Topic: 1476 Message: 1506

Hi Perrin,
I was pretty sure we had this one almost fixed.
As to pin 5 of the LM-386- yes, it should have a DC bias of 1/2Vcc. Being a single ended IC, the most dynamic range is achieved by having the output quiescent voltage sit at 1/2 the supply voltage.
I think you told me that you saw audio breakup on the input of the LM-386, (wioer of the AF Gain pot- and if so we can now rule it out.

I think you said you have a scope- and you should be looking at these DC voltages with a scope and AC coupling so you can see small changes. A voltmeter may miss them.
Let's look at Pin 7 of U9CB with your modulated RF signal going into the BNC input. If that looks OK under audio breakup conditions, move to pin1 and observe that. With the scope, let's also look at the BFO signal- it is at many places on the top board including the output of the BFO 9850 DDS IC on Pin 21. Careful there the SMD pins are very close.
The mystery continues.

Subject: [X1M_QRP-Transceiver] Re: XM-1 Audio break up

Hi Dale,

I managed to have another look at my X1M-PRO and here are the findings:

The regulator output pins for the 9V and 5V regs are +8.85V, and +5.04V respectively. There is no noticeable change in voltage when the radio goes into Audio "breakup".

Apart from the 9V regulator being 'slightly' low, I have not seen anything that jumps out at me yet.

Here are 2 things I have noticed:

- There is +4.43V DC on the LM386 output pin. Is this normal?

- When I touch my multimeter probe on either Pin 1, 2 or 5 of the LM386 I hear AM BC stations. :)

I am not sure what to try / do / check next. Any further advice that you, or anyone else on the group can give me would be greatly appreciated.

73, Perrin

PS- I just ordered an EFT-10/20/40 Trail Friendly. I'm looking forward to using this one!

> > With the same modulated RF signal in and the AF Gain up sufficiently to cause the audio breakup, look at the input and output of U1A (7805) and the in/out of U2A (7809). These points are not easily accessed, so look at the +9 and +5 precision voltages where they are distributed on the top board. eg +9 is available on pin 6 of the LM386. U1A is near the edge of the bottom board and you should be able to get a probe on its output. The +5 is derived from the +9 regulator. There's more to check but let's start there.

Congratulations Andy !! Yes band and time like Paul said would be interesting to know . Not sure of the distance , but that may be the longest distance I have seen posted yet by an X1M user . We need someone to keep records :)

We could have a nice little club and awards along with this group , since so far we are a pretty unique set of users and our numbers are not that large yet .

I still would like to give a net a try , maybe on Sunday afternoons on 20 and maybe a second net Sunday evenings on 40 , to exchange information and get to know other users .

Ian,

Any TTL converter should be suitable. Luckily, these are very common for programming mictrocontrollers such as the Adruino series, ATMEL and PIC's etc.

You'll find a HEAP of them on eBay here
http://www.ebay.com.au/sch/i.html?_odkw=TTL+converter&_osacat=0&_from=R40&_trksid=p2045573.m570.l1313.TR0.TRC0.XUSB+TTL+converter&_nkw=USB+TTL+converter&_sacat=0

Specifically, if you want to use the converter you already have, one like this would suit
http://www.ebay.com.au/itm/MAX232-RS232-To-TTL-Converter-Adapt-er-Module-Board-/260781677532?pt=AU_B_I_Electrical_Test_Equipment&hash=item3cb7cc9bdc

Or, direct from USB to TTL here
http://www.ebay.com.au/itm/1PCS-New-PL2303HX-USB-To-RS232-TTL-Auto-Converter-Adapter-Module-For-arduino-/141051898000?pt=AU_CablesConnectors&hash=item20d7592890

There's plenty of other sources such as Farnell/Element14 etc, but the chinese clones are nice an cheap (only a few $$ delivered).

Subject: [X1M_QRP-Transceiver] X1M PC Cable

Hello,

I an a newbie to this group, to HF operation and to owning an X1M.

As a "grey nomad" I purchased the X1M to take on the road in our caravan, and have just completed making a vertical antenna with a collapsible 10m Squid pole

I have a question I hope someone on the group can answer...

I have a 9 pin to USB lead. The only marking on it is "HL 340". Does anyone know if this is suitable to use with the X1M and HRD? (i.e. is it TTL and not RS232) I don't really know the difference, however I'm told it must be TTL for the X1M.

Is there a way to test? e.g. voltage pin out config etc?

Regards,

Ian (VK3YIC)

Great stuff Andy!

I worked portable with my X1M, from a state park on the north shore of Long Island yesterday afternoon. 6 contacts. Mexico on 10, UK, Scotland, and The Azores on 15, and Italy and Austria on 17. This was with a jump-start battery pack, an Emtech ZM-2 tuner, and some wire hoisted into a tree as a vertical.

Reception was so good that I had to turn off the pre-amp to keep from overloading.

Yes Gary just wait it out, I think this little radio will be the cats meow once the kinks are ironed out.
For your dollar not much else to choose at this time.
The KN-920 needs some serious work as well and there is much better rigs to buy for that money. Yimin from YouKits will be in China at his factory for a few months middle of October working on the TJ5A 20 watts all band radio as well.
The Alinco rigs are cheap dollar wise for all bands, so wait it out and see what happens..

Hello All,

For some of us, waiting is the only option. I haven't gotten any replies from my last two tries of contacting Dale. I hate not getting any details at all. The last I heard, radios should've been in around the beginning of this month. Now word from a third party has it that it may be into October or November till radios ship?? Again, cannot fault the seller for factory issues. BUT, I do think Dale needs to keep up with those of us who have been waiting things out . . . especially when the time span has been several months My sense of optimism has given out, but I'm still hoping to get something for what I paid for. Sorry about the gripe fest folks . . .

Personally I hope they manage to ship a few Beta radios off of this run to the USA , ASAP , to see what is coming in the next run whenever that is . It would be great if the next run has resolved the current issues .

That being said I hope everyone that is fortunate enough to have received one is at least having a ball playing with it at least on SSB and not just letting it sit on the shelf and waiting for an update .

I don't know a thing about Kight radio or the person that operates it . Never even heard of either until I joined this group. There is not any excuse for a business not to offer a common courtesy of responding to a paying customer .

Does he still advertise them for sale ? I guess I should take the time to look at his web page , but I have been so satisfied dealing with Ed , I have no reason to look anywhere else .

I am beginning to enjoy all of the different radios coming out of China and hope that Ed adds some of them to his line.

Yes some of them have problems but I like the challenge up to the software/firmware . IF ONE of the companies would put that in the public domain , I would sure be on top of that radio !! ANYONE IN CHINA LISTENING ?? LOL That would make a HUGE difference in sales here in the USA !!

Charlie , W5COV

Hi Dale,

I have had a 'poke around' the LM358 on the top board (located between the LM386 and the volume pot - I assume this is U9CB as I have the schematic but not a component/board layout diagram.)

Pin 7 and pin 1 go crazy when the audio breakup occurs - I am seeing the same thing that I have observed in the previous tests around the LM386 and the volume pot pins.

What should I see on 9850 DDS IC on Pin 21? I am seeing what looks like a steady HF sine signal that is not changing with the audio breakup. (I guess this rules out the BFO?)... note - I have noticed that my CRO probe "loads" this pin down and reduces my audio output a little when it is connected.

Hmmm. Nothing is jumping out at me yet. What do you recommend I try next? Deeper into the audio stage we go perhaps?

Thanks again for your help!

---In x1m_qrp-transceiver@yahoogroups.com, <parinc1@...> wrote:

Hi Perrin,

I was pretty sure we had this one almost fixed.

As to pin 5 of the LM-386- yes, it should have a DC bias of 1/2Vcc. Being a single ended IC, the most dynamic range is achieved by having the output quiescent voltage sit at 1/2 the supply voltage.

I think you told me that you saw audio breakup on the input of the LM-386, (wioer of the AF Gain pot- and if so we can now rule it out.

I think you said you have a scope- and you should be looking at these DC voltages with a scope and AC coupling so you can see small changes. A voltmeter may miss them.

Let's look at Pin 7 of U9CB with your modulated RF signal going into the BNC input. If that looks OK under audio breakup conditions, move to pin1 and observe that. With the scope, let's also look at the BFO signal- it is at many places on the top board including the output of the BFO 9850 DDS IC on Pin 21. Careful there the SMD pins are very close.

The mystery continues.

Subject: [X1M_QRP-Transceiver] Re: XM-1 Audio break up

Hi Dale,

I managed to have another look at my X1M-PRO and here are the findings:

The regulator output pins for the 9V and 5V regs are +8.85V, and +5.04V respectively. There is no noticeable change in voltage when the radio goes into Audio "breakup".

Apart from the 9V regulator being 'slightly' low, I have not seen anything that jumps out at me yet.

Here are 2 things I have noticed:

- There is +4.43V DC on the LM386 output pin. Is this normal?

- When I touch my multimeter probe on either Pin 1, 2 or 5 of the LM386 I hear AM BC stations. :)

I am not sure what to try / do / check next. Any further advice that you, or anyone else on the group can give me would be greatly appreciated.

73, Perrin

PS- I just ordered an EFT-10/20/40 Trail Friendly. I'm looking forward to using this one!

points are not easily accessed, so look at the +9 and +5 precision voltages where they are distributed on the top board. eg +9 is available on pin 6 of the LM386. U1A is near the edge of the bottom board and you should be able to get a probe on its output. The +5 is derived from the +9 regulator. There's more to check but let's start there.

Maybe we already did this, but look again at the middle pin of the AF Gain pot (wiper) and see what that looks like during breakup. We still need to look at t U9CA and U9CB pins referenced in my earlier post. I believe (I'll confirm later) U9 is the SMD chip between the AF pot and LM386.
If things look good there- we have a bad LM386. I had one go squirrelly in a Dentron MLX-20B QRP rig. So it can happen.

Hi,

Take a look at comment 2 on this page. The pin 7 cap to ground helps with noise on the power rails, and my experience with AD9850s suggests they put out lots of noise. If the pin 7 to ground cap is defective or even at the limit of the normal +\- 50% tolerance, you might see distortion at higher volumes...

http://www.edaboard.com/thread259609.html

Maybe you could parallel another cap with yours to test...

Hi Dale and onionman51,

@Dale - I have checked this out in the past. The AF Gain pot middle pin goes 'crazy' during the audio breakup. So do the pins of U9 (assuming U9 is the IC located between the Volume Pot and the LM386)... From my earlier post: "Pin 7 and pin 1 go crazy when the audio breakup occurs - I am seeing the same thing that I have observed in the previous tests around the LM386 and the volume pot pins."

@onionman51 - Thanks for this advice and information. I will have a look at this capacitor value and will let you know what I find. Interesting stuff!

-So, pending the LM386 pin7 capacitor value is good, I might replace the LM386 for good measure. (As you say Dale, it may have a problem)... I wish the problem was obvious, but these thing never seem to be easy when you want them to be. :) ... I will report back, but welcome any other thoughts you may have.

Thanks again guys! :)

Thank you for the update Perrin,
When you mentioned Pin 7 and Pin1 I was not looking at the schematic and did not know you were referring to U9 pins.
This then would seem to move us away from issues with the LM386 itself.
When you looked at the 9V rail during break up - I am assuming this was with a scope? If not, we need to observe it under break up- AC coupled to the scope so you can see smaller fluctuations. At the very least put your voltmeter on AC so you can see fluctuations better, but the scope would be far better.
Fascinating!

Subject: [X1M_QRP-Transceiver] RE: XM-1 Audio break up

Hi Dale,

I have had a 'poke around' the LM358 on the top board (located between the LM386 and the volume pot - I assume this is U9CB as I have the schematic but not a component/board layout diagram.)

Pin 7 and pin 1 go crazy when the audio breakup occurs - I am seeing the same thing that I have observed in the previous tests around the LM386 and the volume pot pins.

< p style="color:rgb(0, 0, 0);font-size:13px;font-family:arial, helvetica, clean, sans-serif;background-color:transparent;font-style:normal;">What should I see on 9850 DDS IC on Pin 21? I am seeing what looks like a steady HF sine signal that is not changing with the audio breakup. (I guess this rules out the BFO?)... note - I have noticed that my CRO probe "loads" this pin down and reduces my audio output a little when it is connected.

Hmmm. Nothing is jumping out at me yet. What do you recommend I try next? Deeper into the audio stage we go perhaps?

Thanks again for your help!

Perrin VK3XPT

1524. How are you using your X1M & Which version ??

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-24 20:54:50 UTC
From: Charlie , W5COV
Topic: 1524 Message: 1524

*I personally am interested in what modes , tuners , antennas , bands that everyone is using their X1M on and which version you are using .

Mine is eventually going to make its way to my MF/LF/VLF area to transmit only with as an exciter on most bands and "may" see service on the Part 15 , 1750 meter band as a low power QRSS / WSPR beacon transmitter . I have to lower the input power to 1 watt to conform to the rules .

Is there anyone else either using or planning to use it on (USA Part 5 Experimental Bands) or international ham bands in most countries around the world at either 600/630 meters or 2200 meters ? (AGAIN a copy of the software would be nice to be able to change it where it would also cover the 4,000 meter band , the change needed is just in the software) ANY EXPERIMENTERS IN CHINA LISTENING ??????

It will make an excellent exciter , and I am interested in seeing anyone else that is going to use it on these bands , plans / diagrams of filters , amplifiers , loading systems , antennas , and any related items .

As it comes from the factory , the receiver is not very "hot" below 500 kHz. I am also interested to see if anyone has done any work or changes to the receiver to see if perhaps there is an attenuator switched in below 500 kHz. that is common practice in pretty much the entire industry . So right now , I will still be using my SLM plus E-Probe as my receiver for doing any serious listening . I am building both a single turn loop and a multi turn loop to run comparisons with the E-Probe .

I am also building a couple of transverters for the experimental bands to use with it too . It is an excellent little rig for use with a transverter , whether you enjoy MF/LF/VLF , as I do , or you are looking for the IF rig for a VHF / UHF / Microwave , transverter running as a phone transmitter or CW beacon .

When not on these frequencies , you can usually find me on 17 meters and occasionally 20 meters QRP phone with it .

I also enjoy WSPR on 30 and 20 meters with it . Also I have found it plenty stable enough to spend a lot of time listening to QRSS and WSPR on 30 and 20 meters .

My only antenna for HF right now is a G5RV and run the X1M through either my manual home brew antenna tuner , or usually through my LDG auto tuner . The G5RV is only "about" 30 feet at the apex . Actually a couple of feet lower . It is more in an inverted vee configuration because the ends of the G5RV
(102 foot model) are 10 to 15 feet off of the ground .My ladder line is

not even fully extended , but I still work DX every time that I get on the air and the bands are anywhere close to decent . I have become quite fond of 17 meters .

So if you have a decent antenna or better yet an omniangle HF antenna , like Dale manufactures ,
(**http://www.parelectronics.com/hf-omnis.php) ,or something like a Moxon or a yagi , you will have a ball working all of the stations that you want .

Ed (http://www.importcommunications.com) also sells a tiny audio filter , made to go with the X1M . It is a great little filter made to match the radio in size and has excellent performance for both phone and CW . A worthwhile addition to ANY station , especially QRP to help dig the weak ones out . You can vary both the center frequency and bandwidth . It is under accessories from the main page .

LOTS of ways and places to use the X1M just as it is , have some fun , while waiting for a firmware update , and maybe even explore some new modes and bands .

(USUAL DISCLAIMER HERE , NO FINANCIAL INTEREST , etc. , etc. , JUST AN IDEAL RIG FOR ME AND HOW I OPERATE .)

I am an avid Part 15 operator , even up to the 22 meter band . QRSS & WSPR are fun , if you haven't tried either of them take some time to listen , you might just get hooked . I am the owner/moderator of the Yahoo part15 (no space between part and 15) group , if you have any interest in true QRPp operation and the results can be pretty amazing , then come join us . Certainly not too crowded to find you a spot to put a beacon on .

USE THEM & ENJOY THEM !!

Charlie , W5COV

Hi Charlie and the group,

I am not sure yet. The delivery of my XM1 Platinum is delayed as my ham friend who was bringing it across the pond for me has had to delay the trip because of illness. The first thing I want to do is to check it out technically. The open transmit feature appeals for LF work and I might see if I can use a micro controller to operate the RX remotely....

73s from a grey day in England....

Steve & Group ,

Sorry to hear about your friend . Hope he gets back to normal quickly . Your report will be interesting . Is the micro controller going to be a part of your group lessons ? I was going to try and participate in that but never remember to be around when I need to be . I hope you will share ahead of time if you are going to do it over the net .

I ordered the latest version of the Ultimate 2 firmware today , so that I can use it on 1750 meters as a side by side comparison of the two modes . I have a friend about 600 miles from me that leaves a grabber running on the frequency of my choice so I can see in real time any changes I make here at my transmitting station , on his grabber .

It worked very very well last season for some great experiments and since we have a 30 kHz. wide band to play in , I was able to play with most of my very narrow modes and nobody else in the USA even knew I was testing all winter long , unless I wanted to check at different distances and moved down into the "watering hole." It was indeed a fun season and I learned a lot and have more experiments planned this year .

73's and looking forward to your getting the X1M Pro in hand soon.

Charlie , W5COV

Hi Charlie,

I would hope to include it in my lessons. At the moment I am writing a chapter on an introduction to "C" and one on basic micro controllers. I decided to shift these things out of the general lessons because I now have to cover two micro controllers. Each general lesson will feature a stand alone project illustrating a particular skill. As usual I under estimated the time this stuff takes and the amount of disposable brain power I have...

Good luck with the Ultimate 2. It's nothing to do with me now. I am sure that Hans can deal with anything that comes up....

Hi Steve ,

I hope you post it here on this group , so I can participate . I am getting old enough that I have memory issues and it is always good to get refreshed or to see it from the point of view of someone else . Plus there are so many platforms available now , I can not keep up with all of them as well as I should .

I knew that Hans had taken over the last runs . I have been waiting to see if you were going to have time to offer your own products . I have always been with them since the start . I pretty much was able to figure out the situation and I very much appreciate the contributions that you made from the start and I am certainly thrilled to see you on this group and am certain that you will contribute some interesting information and devices.

1529. X1M for sale PRICE REDUCED

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-25 13:16:48 UTC
From: sbjohnston@...
Topic: 1478 Message: 1529

X1M FOR SALE - PRICE REDUCED

I'm selling the X1M transceiver purchased by me at the Dayton show this spring. Shortly after purchase I successfully adjusted the frequencies of the various offsets to get the radio operating correctly on both sidebands, and have adjusted the CW sidetone and mic levels for good performance. I also added access holes in the case for these adjustments so future operators will not need to open the case to make changes. These access ports were made using the same technique as the other holes in the case - they look nice.

I've made numerous contacts on both CW and SSB with this rig - after my adjustments it works as specified. Why sell it? It bothers me that the transmit bandpass filters kick out on the high end of 80 and 40 meters. But this is probably not an issue for many other users.

Unlike new units, this X1M transceiver is tuned and ready to us.

Price $260 postpaid to the continental USA (Other destinations with additional shipping charge).

Contact me at sbjohnston@... if you'd like to buy this rig.

From: Dale Parfitt
Topic: 1530 Message: 1530

I spent the day experimenting with different AGC designs. What I have at this point is a circuit whose output varies 16dB when the input varies 60dB (from -90dBm to -30dBm). I'll play with it a while and build one up for W5COV and then have SMD circuit boards made up after Charlie gives it his blessing. There are always tradeoffs in AGC- threshold, stability, settling time, attack, hang, decay. This one looks pretty good, not perfect, for both CW and SSB.

Great stuff Dale!

Would it be simple enough to make the AGC switchable (in/out)? Perhaps by mounting a toggle switch in the rear panel?

Cheers,

Perrin, vk3xpt

Yes, that could be done- just a SPST switch. It would be nice to have a software switch to do it- but I may be dreaming there. One of the neat things about the MC1350 is that if you leave pin 5 open, it will set itself to the threshold point. Thus, just disconnecting the AGC line to pin 5 results in the MC1350 running at max gain.

Any new developments on your breakup issue?

That's great Dale. I am looking forward to seeing this mod in action!

I have not had a chance to look further at the audio break up as yet. I will do ASAP. FYI: I am using a scope (a 20MHz CRO) when looking at the issues. I will report back in the "audio break up thread" with the results.

Cheers,

Can I get a rough show of hands as to how many might be interested in adding AGC to their X1M PRO's?

Once the design is finalized, I'll order boards and SMD parts. I envision the board as being smaller than a postage stamp and affixing to the top board via @X tape directly behind the LM386 IC. You will have to lift pin 5 of the MC1350 and make 4 connections- GND/VCC/ Audio In/AGC out.

Tnx,

Dale W4OP

I have an older unit. Will the AGC work with the older unit. If so count me in.

Can I get a rough show of hands as to how many might be interested in adding AGC to their X1M PRO's?

Once the design is finalized, I'll order boards and SMD parts. I envision the board as being smaller than a postage stamp and affixing to the top board via @X tape directly behind the LM386 IC. You will have to lift pin 5 of the MC1350 and make 4 connections- GND/VCC/ Audio In/AGC out.

Tnx,

Dale W4OP

Yes Keith it will work with the older unit , but Dale is correct the MC1350 is surface mount in the older unit and pin 5 is in a pretty tight location . If you can do surface mount work on an 8 pin IC , then you certainly have room around the LM-386 to mount the addition .

Great News!!!!!

A few days ago I ordered some new LM386's, and they arrived here today. I ordered these because all of the testing I have done so far been rather inconclusive, with the audio breakup being 'visible' on the scope basically everywhere in the audio stage (It was not really pointing me one way or another)... I wanted to replace my LM386 before I started digging too much deeper into my X1M-PRO to see if there was any change...

Guess what!? Problem SOLVED! The new LM386 has done the trick! No more audio break-ups here. I am now a happy X1M-PRO user!

Thanks especially to Dale W4OP, and also the rest of the group for your help and suggestions. Now I will be able to jump head first into the AGC modifications knowing that all is well with my rig!

Thank you for the update Perrin,

When you mentioned Pin 7 and Pin1 I was not looking at the schematic and did not know you were referring to U9 pins.

This then would seem to move us away from issues with the LM386 itself.

When you looked at the 9V rail during break up - I am assuming this was with a scope? If not, we need to observe it under break up- AC coupled to the scope so you can see smaller fluctuations. At the very least put your voltmeter on AC so you can see fluctuations better, but the scope would be far better.

Fascinating!

Subject: [X1M_QRP-Transceiver] RE: XM-1 Audio break up

Hi Dale and onionman51,

@Dale - I have checked this out in the past. The AF Gain pot middle pin goes 'crazy' during the audio breakup. So do the pins of U9 (assuming U9 is the IC located between the Volume Pot and the LM386)... From my earlier post: "Pin 7 and pin 1 go crazy when the audio breakup occurs - I am seeing the same thing that I have observed in the previous tests around the LM386 and the volume pot pins."

@onionman51 - Thanks for this advice and information. I will have a look at this capacitor value and will let you know what I find. Interesting stuff!

-So, pending the LM386 pin7 capacitor value is good, I might replace the LM386 for good measure. (As you say Dale, it may have a problem)... I wish the problem was obvious, but these thing never seem to be easy when you want them to be. :) ... I will report back, but welcome any other thoughts you may have.

Thanks again guys! :)

Maybe we already did this, but look again at the middle pin of the AF Gain pot (wiper) and see what that looks like during breakup. We still need to look at t U9CA and U9CB pins referenced in my earlier post. I believe (I'll confirm later) U9 is the SMD chip between the AF pot and LM386.

If things look good there- we have a bad LM386. I had one go squirrelly in a Dentron MLX-20B QRP rig. So it can happen.

Hi Dale,

I have had a 'poke around' the LM358 on the top board (located between the LM386 and the volume pot - I assume this is U9CB as I have the schematic but not a component/board layout diagram.)

Pin 7 and pin 1 go crazy when the audio breakup occurs - I am seeing the same thing that I have observed in the previous tests around the LM386 and the volume pot pins.

< p style="color:rgb(0, 0, 0);font-size:13px;font-family:arial, helvetica, clean, sans-serif;background-color:transparent;font-style:normal;">What should I see on 9850 DDS IC on Pin 21? I am seeing what looks like a steady HF sine signal that is not changing with the audio breakup. (I guess this rules out the BFO?)... note - I have noticed that my CRO probe "loads" this pin down and reduces my audio output a little when it is connected.

Hmmm. Nothing is jumping out at me yet. What do you recommend I try next? Deeper into the audio stage we go perhaps?

Thanks again for your help!

Indeed you did mention that Dale, and as it is easy to replace I figured it was worth doing.

There was another group member who had a similar problem a couple of months ago I recall, so hopefully this info will help some others along the way.

Thanks again Dale for your great help with this one!

Once the design is finalized, I'll order boards and SMD parts. I envision the board as being smaller than a postage stamp and affixing to the top board via @X tape directly behind the LM386 IC. You will have to lift pin 5 of the MC1350 and make 4 connections- GND/VCC/ Audio In/AGC out.

Tnx,

Zsolt,
At this time we are waiting for new firmware. If you adjust the cw BFO so that the transmitted signal is on the indicated dial frequency (use a calibrated receiver or a frequency counter), you will find that a received signal on that frequency is zero beat - there is no audible beatnote. RIT and SPLIT mode both fail to work correctly in cw. To do cw now you must receive on one VFO and transmit on the other, and switch manually between them to go from RX to TX and back, or, do cw in SSB mode by injecting an audio tone into the mic input as you would to operate PSK31 or some other digital mode.

We are all hoping the new firmware will correct these problems and be released soon.

Hallo Dale

Do You have Pro version of x1m?
My Pro seems do the same. Seems mistake in programming of keyer. They missed value of spacing.
Other folks seems use external key or stright one :)
Can You heard some progress in this case?
Andris YL2FD

---In X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> wrote:

☐
I have just completed looking at the keyer in the XM-1.

I set the speed at 25wpm for convenience.

DOTS= 25mSec

DASHES= 75MSec

So far so good as theoretically a dash= 3XDot

Dot spaces= 74MSec

Dash Spaces=74MSec

In theory a the space between successive dots (element spacing) = 1DOT length and the same for Dashes.

So Dash spaces are 3X longer than they should be and dot spaces are also 3X longer than they should be.

The spacing between characters is 5XDot- some like this feature, others do not.

Some variance is OK -known as weighting, but w/o that feature, the keyer should be spot on as to the dot and dash length and element spacing.

If this data reaches the designers, please also ask them to add dot and dash memory. The coding is simple and makes the keyer so much more usable.

Dale W4OP

I do not have an original model, but do know that the MC1350 is an SMD in that model, so you will have to be working with that.
Again, I have no way of testing the AGC ckt on the original model.

Yes, mine is the PRO version. The issue is the element spacing (from memory) they are using 3X DOT length in between elements and it should be=DOT length. The bug has been reported.

In theory a the space between successive dots (element spacing) = 1DOT length and the same for Dashes.

So Dash spaces are 3X longer than they should be and dot spaces are also 3X longer than they should be.

The spacing between characters is 5XDot- some like this feature, others do not.

Some variance is OK -known as weighting, but w/o that feature, the keyer should be spot on as to the dot and dash length and element spacing.

If this data reaches the designers, please also ask them to add dot and dash memory. The coding is simple and makes the keyer so much more usable.

1579. Key down

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-04 06:58:52 UTC
From: Victor Schensnovich
Topic: 1579 Message: 1579

Hi friends, who knows, if I want to tune antenna, how to do key down and is it possible to adjust power output?
Victor, UA1CEX.

Hello Victor,

You can hold down a straight morse key, and that will send out a carrier at maximum power. Or you can use an Iambic paddle and send several strings of dits. (This will drop the carrier between dits, and thus will help to prevent over-heating your rig.

Cheers,

David Harvey, VK2DMH

Ok David, thank you for your info. I thought, maybe, some function in
menu for this purpose. Do you know, where it is possible to download
shematic of X1M pro?

Set to CW, press key. Use the "manual" keyer position. No way to adjust power, however. If you were to use tone injection, then power out proportional to tone level in, however.

Hi Victor ,

There are schematics in the files section of this group for both the original X1M and the PRO also .

Paul has you covered on the other questions . Paul was the editor in chief and one of the consultants that also wrote a manual and a "cheat sheet" for the PRO , which is also in the files section for this group .

Paul and I both use sound card digital modes . You can adjust your output level by by controlling the amount of audio going to the radio for this as well as in regular LSB and USB phone modes .

Like Paul said , there is no way to change the CW output power .

OOOPS I see Paul covered the tone injection for power level too .

I just stated it a little different .

How much lower in CW power do you want , or need to go ? If you are needing to drop it for a transverter you can always insert an attenuator in the input line , which is what I do when I drive my 600 meter , 1750 meter , and 2200 meter transverter . I also do the same thing to drive my VHF 222 MHz. transverter .

I switch the external attenuator out on receive .

So I got a set of finals, took the old ones out and checked to see if I had any other issues in the area of the finals other than the burnt trace and all looked good. Replaced the finals and repaired the burnt trace. Turned power on and no smoke, keyed up with dummy load and watt meter on and RF power turned all the way down, brought power up to two(2) watts and keyed for a few seconds, smiled and then poof, magic smoke on the other final trace and blew same way first one did. Told supplier who asked me to send it to him who would send to maker and if other issue causing problem that they would cover cost of shipping. I said no thanks will bite the bullet on this one and let someone else play with it. Buy something else gang, I just picked up Vertex VX-1700 for $600.00 shipped that was in near new condition..So be careful

Charlie is much to kind on my writing efforts. I have found that if I either write up something, or teach it, I get a better understanding (25+ years in the college classroom).

Charlie and Fred contributed a GREAT DEAL to my understanding.

It is ironic, my X1M pooped out on 20, 15, and 10 meters, or actually may never have worked at all on those bands. I returned it to Ed, and of course, I am waiting like everyone else for the late October production run. I am suffering serious withdrawal symptoms.... <grin>

Hello All,

Just wanted to report my first contacts were made today on15 and 20 meters SSB!! I worked 6 guys during the California QSO Party contest today from my home near Dayton, Ohio!

Working condx:

XM1 Pro

Stock hand Mic

MFJ qrp wattmeter

Antenna: 1000 ft. horizontal loop @ 45ft fed with homebrew open wire feeders. (maybe thats cheating?? hi)

DX engineering 1:1 current balun

Amp Supply AT-1200 tuner (20 meters)
LDG z-11 Pro2 15 meters

Power out: 5 watts

Cant wait for the AGC mod as the static crashes were murder here today!!

73 all de Kent

GREAT to see you having fun with it Kent !!! Naw not cheating at all . QRP is more about the antenna than anything else . Some great designs have come from QRP operation .

Lots of guys use beverages into the thousands of feet . I likely am going to be among that group at times this winter when I go to the farm to do my MF/LF listening tests and experiments .

You are just one of the really fortunate guys to have the room for such a good antenna . Lots of guys use many element beams on towers that go into the hundreds of feet , some people live on nice high locations .

Your antenna is also an advantage to other QRP operators , that you likely wouldn't hear if you didn't have it .

Congratulations !!

Ian , this week has been pretty bad here for conditions so if yours have been anywhere close to similar , that is a great contact .

Once enough people , like you , around the world get these sweet little gems in their hands , we are going to have to have a weekly net and or some suggested "watering hole" frequencies on the different bands so we can all work other X1M 's . I have made many contacts , but none so far with another X1M .

I am however going to be doing some other antenna work this week , improving antennas , including adding an

OMNIANGLE , designed and built by our own group member W4OP , Dale Parfitt , (X1M AGC Designer)

http://www.parelectronics.com/hf-omnis.php

So hopefully this winter I am going to be working many of you .

1595. RE: Audio Compression 'Accessory Circuit' Idea to Increase SSB Output

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-06 00:58:15 UTC
From: <lphebus@...>
Topic: 1193 Message: 1595

I've bread boarded and tested an audio compressor circuit. Pictures are in the "Photos" section. Compression is adjustable from 1:1 to 6.25:1 which seems like plenty to me. It really helps the audio "punch" of the X1M. My plan is to put the circuit in the microphone case with a couple AAA batteries for power. I thought I would use a design like this http://www.qrpkits.com/microphone.html . I tried to power it from the +5 volts the socket provides for the electret microphone, but the compressor current draw, although small (<3mA), loaded the 5V down to about 1.7 V. I am surprised by this. The AAA batteries should last a long time however. There are two potentiometers (blue) in the bread boarded circuit. The left is the compression level (Rcomp) and the right is the attenuator adjustment. The output of the compressor chip is a bit too high to feed directly into the X1M.

---In x1m_qrp-transceiver@yahoogroups.com, <cvest@...> wrote:

LOL Maybe that is why I am an old bachelor . My two dogs don't seem to complain at all and I am a true night person so I am not normally even on the net this early in the morning .

I work DX , various digital modes , the part 15 bands , and I am working on a new part 5 license , where the bands are night time bands , plus I have always enjoyed the peace and quiet of the wee morning hours .

If the bands aren't open I ALWAYS have at least one project on the bench that I am building and usually several at the same time .

However since I went to computer logging , I have gone back to using headsets , so my hands are pretty much free to type when I am on phone . One day I may need to add VOX to the X1M . Right now I have a momentary push button in a film can type plastic container to activate the PTT , until I decide what I want to put in a mic interface box for this little gem or see if I can possibly work with smaller SMT devices and squeeze something inside of it. I can go smaller but 1206 are the smallest I am really at ease with and they are fast disappearing from the market .

I bit the bullet and ordered a ssm2167 on a breakout board from them. I decided against soiling my playing with bad soldering fruseration for the moment and instead will forgo the extra coffee one day. I'm thinking and inline version would be the most useful to start out -- plug the mic into the inline box and then have a tail from the board into the rig. There isn't any room in the rig to stick it easily and putting it directly into the mic would limit it to one circuit per mic... also not flexible. The other option is a larger block in the middle of the mic cable but that seems the wrong way.

Anyone have any thoughts on a performed form factor for it?

The more and more I look at this the more and more I want to play with little chip but it is in a tiny tiny MSOP package. And my soldering skills/hand steadiness is NO WHERE near close enough to jump right in. Anyone have a great easy way to put an MSOP chip onto a breadboard or anything like that? I've seen some 'easy' convertors for SMD chips but none for MSOP -- and I guess I haven't looked to see if they would work. Anyway -- if anyone has any great suggestions I'd appreciate it!

-Chris

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:

Thank Ken! Yup I'm thinking with 5 w I'm going to want the most talk power for the punch of my voice. Although I haven't done the math to see the difference between 0.5w and 5w. if my db brain remembers it probably isn't that much ! much like the difference between 5w and 100w ;) But I suspect it is bigger if I compare 0.5 w to 100w ;) And the goal is to get it as compressed and gained right to point before degrading! And we will see where that lands me! And to top that off the neighbor in the new apartment is really sensitive to me talking at night -- she has come twice at 1am to ask me to keep it down while conversing with a friend at lower than normal voices already. So the more punch I can get out of the mic at lower levels the more I can work in the nighhhhhhht!

And thanks for the thumbs up I'm loving the trip!

-Chris

--- In x1m_qrp-transceiver@yahoogroups.com, <krtdowns@...> wrote:

Great attitude, Chris! I'm not familiar with that IC, but it sounds as though it has the functions you are seeking. Reasonable compression will add substantially to your "talk power." Like most things, it can be overdone and degrade your signal. Sounds as though you are tackling the learning opportunities this little rig offers with zest and enthusiasm. Have fun and enjoy the trip!

Ken, W1KRT

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:

Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip:

http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together.

Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

-Chris

Follow pin 1 on the LM386 and depending on which model you have the resistor that needs to be jumpered will be in different places . Anyway it is resistor R63c that needs to be jumpered (shorted across) . Easy to find following pin 1 on the LM386 . Jumper between pin 1 and the capacitor . ONLY the resistor needs to be jumpered , not the capacitor . BIG DIFFERENCE IN AUDIO !!!

Please lt us know your opinion once you make the change .

Dear friends, if I want to tune a freq. I can choose a step 10hz, 100hz etc. But 10hz will be very slowly, 100hz is not comfortable. Is it possible to do 25 or 50hz step?
Victor, UA1CEX.

No Victor , not possible at current firmware levels . Perhaps something
to add to a future firmware upgrade .

Ok, Charlie. I am CW man. What is IF filter for CW? The same like for
SSB or narrow? I tried to find video in youtube.com with CW but there is
only SSB. It will be interesting to listen walking around CW segment,
what a sound. In file section CW video - sitting on one freq. It is not
so interesting.
Victor, UA1CEX.

Same filter as for SSB , however they make an external filter based on
the size of the radio from Xiegu . It is good for SSB and CW .

This is the one that I use , that came from Ed also at
http://www.importcommunications.com

Here is the direct link to it :

Victor , I need to learn how to make youtube videos . I can demonstrate all of the features and also the performance with and without the filter , as well as making the mods .

I spend time using both models of the X1M daily . I am waiting to get some antenna work done this week to improve my signal , and then will try to have my granddaughter show me how to make a video . I am also excited to be adding one of (Dale Parfitt , W4OP, designer of the add on internal AGC system for the X1M and group member here) his Omniangle HF antennas that he manufactures , to give me true omni directional coverage , and not have to worry about a rotor.
Information on Dale's products is here :
http://www.parelectronics.com/hf-omnis.php

If you read some of the earlier posts , you will see that Dale has designed an AGC board using SMD that will fit internally in the X1M . If you want one , you need to post it on the list attention of Dale , or let him know . You sure can't beat the price , so it is fair that we visit his page to thank him for what he is doing , as well as doing much more testing and suggestions for a firmware upgrade , that we hope will be coming soon and will GREATLY improve CW and some other issues .

The audio gain adjustment is easy to do and well worth your time .

I "think" Lee's question is being misunderstood .

What I "think" he wants to know is who all are using the Xiegu external CW / SSB Filter in the SSB MODE :

http://www.importcommunications.com

From the main page select Accessories in the Product window on the left . On the new Page you will see Audio Filter , clicking on the picture of it and it will take you to the specifications page for it . It is built by Xiegu to match the size of the X1M , but can be used with any transceiver .

I have one here and with the adjustable band width wide open , it does work with SSB . Depends on your particular likes and dislikes for listening to SSB . Having done a LOT of contesting over the years I like to use it on SSB , even though some might find it a bit too narrow . If you work CW you will certainly enjoy it .

Hope everyone that has one jumps in here and comments since we all have different likes and dislikes in how we filter the signal for our own personal preference .

I hope too that everyone that buys the X1M also buys the Xiegu TTL interface cable . It is something that you WILL need to do firmware updates .

Subject: [X1M_QRP-Transceiver] RE: Audio Compression 'Accessory Circuit' Idea to Increase SSB Output

I've bread boarded and tested an audio compressor circuit. Pictures are in the "Photos" section. Compression is adjustable from 1:1 to 6.25:1 which seems like plenty to me. It really helps the audio "punch" of the X1M. My plan is to put the circuit in the microphone case with a couple AAA batteries for power. I thought I would use a design like this <http://www.qrpkits.com/microphone.html> http://www.qrpkits.com/microphone.html . I tried to power it from the +5 volts the socket provides for the electret microphone, but the compressor current draw, although small (<3mA), loaded the 5V down to about 1.7 V. I am surprised by this. The AAA batteries should last a long time however. There are two potentiometers (blue) in the bread boarded circuit. The left is the compression level (Rcomp) and the right is the attenuator adjustment. The output of the compressor chip is a bit too high to feed directly into the X1M.

LOL Maybe that is why I am an old bachelor . My two dogs don't seem to complain at all and I am a true night person so I am not normally even on the net this early in the morning .

I work DX , various digital modes , the part 15 bands , and I am working on a new part 5 license , where the bands are night time bands , plus I have always enjoyed the peace and quiet of the wee morning hours .

If the bands aren't open I ALWAYS have at least one project on the bench that I am building and usually several at the same time .

However since I went to computer logging , I have gone back to using headsets , so my hands are pretty much free to type when I am on phone . One day I may need to add VOX to the X1M . Right now I have a momentary push button in a film can type plastic container to activate the PTT , until I decide what I want to put in a mic interface box for this little gem or see if I can possibly work with smaller SMT devices and squeeze something inside of it. I can go smaller but 1206 are the smallest I am really at ease with and they are fast disappearing from the market .

I bit the bullet and ordered a ssm2167 on a breakout board from them. I decided against soiling my playing with bad soldering fruseration for the moment and instead will forgo the extra coffee one day. I'm thinking and inline version would be the most useful to start out -- plug the mic into the inline box and then have a tail from the board into the rig. There isn't any room in the rig to stick it easily and putting it directly into the mic would limit it to one circuit per mic... also not flexible. The other option is a larger block in the middle of the mic cable but that seems the wrong way.

Anyone have any thoughts on a performed form factor for it?

Subject: [X1M_QRP-Transceiver] RE: Audio Compression 'Accessory Circuit' Idea to Increase SSB Output

The more and more I look at this the more and more I want to play with little chip but it is in a tiny tiny MSOP package. And my soldering skills/hand steadiness is NO WHERE near close enough to jump right in. Anyone have a great easy way to put an MSOP chip onto a breadboard or anything like that? I've seen some 'easy' convertors for SMD chips but none for MSOP -- and I guess I haven't looked to see if they would work. Anyway -- if anyone has any great suggestions I'd appreciate it!

-Chris

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:

Thank Ken! Yup I'm thinking with 5 w I'm going to want the most talk power for the punch of my voice. Although I haven't done the math to see the difference between 0.5w and 5w. if my db brain remembers it probably isn't that much ! much like the difference between 5w and 100w ;) But I suspect it is bigger if I compare 0.5 w to 100w ;) And the goal is to get it as compressed and gained right to point before degrading! And we will see where that lands me! And to top that off the neighbor in the new apartment is really sensitive to me talking at night -- she has come twice at 1am to ask me to keep it down while conversing with a friend at lower than normal voices already. So the more punch I can get out of the mic at lower levels the more I can work in the nighhhhhhht!

And thanks for the thumbs up I'm loving the trip!

-Chris

--- In x1m_qrp-transceiver@yahoogroups.com, <krtdowns@...> wrote:

Great attitude, Chris! I'm not familiar with that IC, but it sounds as though it has the functions you are seeking. Reasonable compression will add substantially to your "talk power." Like most things, it can be overdone and degrade your signal. Sounds as though you are tackling the learning opportunities this little rig offers with zest and enthusiasm. Have fun and enjoy the trip!

Ken, W1KRT

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:

Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip:

http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

Hi Victor,
At this time, I cannot do either. I am flooded with work. I am going to try to design the PCB this week and then would have boards here next week. I don't have the time to build up the boards, so this will be a surface mount kit. I'll post the schematic in the files section for those that would like to roll their own.

Ok, Dale. That is fine. But frankly speaking, I am hesitated about AGC. If two stations are very close. One of them is stronge and another one is weak. It will be dificult to receive weak stn. Without AGC you have a chance to receive. What do you think about it?

Looks like both of your converters are Serial Level. The X1M requires TTL level signals on the DB9 port. Import Communications, that is the US dealer for the X1M, sells the proper converter.
This post covers some of the other options.

http://groups.yahoo.com/neo/groups/X1M_QRP-Transceiver/conversations/messages/1509

I bought one of the USB to TTL converters off eBay for about $3 shipped. Just need to add the DB9 connector.

As I develop the PCB layout , I have one of the 4 LM324 op amps unused. Is anyone interested in an external S meter? I may be able to use the 4th op amp for relative signal strength with , say a standard 0-1mA meter.

No promises.

Great idea, sort of like the Ft-897 that has a port for an external meter. I was just looking at the schematic and wondering what the other op amp might be used for.

Thanks, I just ordered one,

On the positive side, within a few hours of receiving the rig, and a few homemade cables, I have my first JT65 QSO in the log.

---In x1m_qrp-transceiver@yahoogroups.com, <r-mason@...> wrote:

Looks like both of your converters are Serial Level. The X1M requires TTL level signals on the DB9 port. Import Communications, that is the US dealer for the X1M, sells the proper converter.
This post covers some of the other options.

http://groups.yahoo.com/neo/groups/X1M_QRP-Transceiver/conversations/messages/1509

I bought one of the USB to TTL converters off eBay for about $3 shipped. Just need to add the DB9 connector.

X1M Pro arrived today and I'm trying to hook it up to HRD, where the settings are Icom 718 and CI-V address 5E

I have an IOGear GUC232a successfully creating a port om my laptop (Vista 32-bit), but it will not connect

I have a USdevices high-end RS232 to USB cable, also successfully creating a port, but still won't connect.

What am I doing wrong?

I think we have a spare pin on the dB9 that could be devoted to the S meter. But I may be getting a bit ahead of myself. I'll breadboard it tomorrow.

I had been looking at adding an "S" meter circuit , but wasn't sure what all your AGC circuit would use on the chip . It is certainly something to consider and the dB9 would be a good spot for it.

Then later if people want to key an amp that doesn't use RF sensing , we can add a jack for that if there is enough interest , or possibly some other useful accessory connection .

Glad to see your great suggestions and would be interested in seeing any other suggested accessories or improvements that are beyond the scope of having the company making changes .

As hams we all have a variety of interests and this is a beautiful little rig to customize , like the guys working on the processor project .

At end of first paragraph on Computer Interfaces in the User's Guide.

This transceiver can be connected to your computer to operate with the
Ham Radio Deluxe
software. A built-in CAT interface makes the X1M also suitable for
automatic logging and control.
The serial interface (9pin Sub-D) on the rear supplies TTL level
signals. An optional interface
provides a level converter to RS-232 levels. The interface emulates an
Icom radio (IC-718).

Topic: 1643 Message: 1643

Hello All,

I was curious about who was still waiting for the X1M from Dale Kight / Kight Radio. With the "rumors" of a late October / early November production run, I would imagine him getting some stock in finally. Is there anyone who has received a radio from Kight recently? More importantly, has anyone been in contact with Dale as of late? My last contact was Aug 20, with no luck since. The lack of response from him is quite a bit frustrating.

Hello, my USB to TTL adaptor has arrived, so now I need to connect it to my DB9.

I checked the schematic, and can't find what I need so hopefully someone in the group can assist. The Pins out on the USB converter are identified as...

3V3

TXD

RXD

GND

+5V

Can anyone please tell me which goes to which pin on the DB9?

All help appreciated.

I bought my X1M from Kight radio and I was very satisfied with the purchase. My only issue would have been a little more information that a newer version was coming out or was already out. But in his defense I was hot and bothered to get one of these small rigs that I didn't think about asking.

I have one of the original designs and I have been very happy with it. Look forward getting the AGC mods done.

Subject: [X1M_QRP-Transceiver] RE: RE: New User with HRD problem

Hello, my USB to TTL adaptor has arrived, so now I need to connect it to my
DB9.

I checked the schematic, and can't find what I need so hopefully someone in
the group can assist. The Pins out on the USB converter are identified as...

3V3

TXD

RXD

GND

+5V

Can anyone please tell me which goes to which pin on the DB9?

All help appreciated.

Ian VK3YIC

Hi everyone,

After going through 2 bad radios, I tried to contact him back in August to no avail. I finally had to get my money from PayPal. I'm going to let this shake out before I buy again.....from Ed at Import Communications.

With the "rumors" of a late October / early November production run, I would imagine him getting some stock in finally. Is there anyone who has received a radio from Kight recently? More importantly, has anyone been in contact with Dale as of late? My last contact was Aug 20, with no luck since. The lack of response from him is quite a bit frustrating.

Well I order one from ED last week and sent it back to him Yesterday.
Almost no audio output. I hope this is not a bad omen.

Hi Mel,
Have you followed the threads on increasing the audio out? What antenna do you use?

Hi friends, looking in the video, sometimes antenna connector is BNC,
sometimes UHF. Who knows why?
Victor, UA1CEX.

Certain zones preferred the SO-239 and here in the USA and some other
places BNC is the "standard" for QRP.

I also think some of the very early models produced also use the SO-239 .

The problem with using the SO-239 here in the USA was the ones being
installed had metric threads and would not properly fit the PL-259
connectors .

Most of us have modified the X1M to increase the audio . There is a resistor (R63c) off of pin 1 of the LM386 audio amplifier that needs to have a jumper placed across it to bring the audio level up to a very decent level using the internal speaker .

Depends on the model. The original was SO-239, the PRO is BNC.

Thanks for accepting my request to join this group.

The call is KD5TTZ, and I am interested in the X1M unit.

I am wanting to work QRP from my work location offshore grid EL58jc.
I work on an oil rig, and being able to see horizon to horizon, I was thinking that this would be a great place to try QRP.

I will be sitting on top of the heliport, with a 50x50 iron plat under the antenna, hoping that this would not hurt anything.
I am looking at several portable antennas, but like the X1M, I'm not quite sold on any yet.

I am open to all opinions as for as the X1M, and a portable HF antenna, it has to be small to fit inside the helicopter for transport.

Do you guys think that this would work ok on the iron plate?
Would being offshore give any advantage to working QRP?
What portable HF antenna would work for my application?

Thanks guys,
KD5TTZ

As far as the X1M Pro goes , you will not find any radio anywhere near the price that will compare with the radio .

It does have an issue transmitting CW , that the factory is aware of and is currently preparing a firmware upgrade to resolve this issue . We believe due to their manufacturing schedule that the firmware should be available likely sometime this month . They have been very cooperative and it is another nice feature of the radio , that it can be upgraded with firmware , so if you buy one be certain to purchase the TTL interface adapter also . They will also include updates in the firmware to allow you to bypass some of the steps currently in the manual , however if you want to tweak it to your particular liking , you can also manually set them by the book and no test equipment is required .

If you follow the manual and the quick start procedure in the files section of this group , you can begin to operate SSB immediately . You do take the top cover off to set the CW sidetone level and also the microphone gain .

The audio sound out of the speaker as currently shipped from the factory , is a little too low for most peoples liking . Most all of us that own them , have made a very simple modification of jumpering one resistor in the radio and it provides all the volume that the speaker can handle . Very simple and easy modification that everyone I know of on the group , has performed by themselves . There is a good chance this will be a change made on the next run of these radios , but they tend to sell out rather quickly , and runs are limited in number .

There is only one distributor in the USA that has any in stock and as of yesterday I understand from reading the group that he had 10 or less in stock . That is Ed , at Import Communications .
http://www.importcommunications.com

I suggest you contact him and he can give you the exact details , since my information comes from reading the group.

I have tried to be as honest as possible , letting you know what I am aware of on both the up and down side .

I have two of them and when I buy another radio , it will be yet another one of them . Like I said with this expected firmware update , then there is no radio built at even twice the price that will compare to this fine little radio .

You should have a very nice groundplane with that 50 X 50 plate , so there are many antennas to choose from . One of the group members , and also an X1M Pro owner is the designer and founder of the original EFHW

antenna of QRP fame . He currently sells other antennas and can give you expert professional advice about antennas for QRP . His web page is http://www.parelectronics.com/index.php

Please feel free to contact him too . His name is Dale .

That should give you enough information and contacts to get other opinions besides mine , which I encourage you to do .

In short I LOVE this LITTLE jewel and you WILL make contacts !!

Thanks for the much appreciated information on the unit.
I have sent an email to import communications asking a few questions about the current stock, and the availability on of a new model if any?

I am looking at the Buddipole style antenna so that I can just set it on the deck. I cannot hang any wires, wish I could. So I am limited to what type of antenna to use.

I would also need a tuner and an SWR bridge. I hope to be able to just put everything in a back pack when not in use, and for easy carry on in the helicopter.

Thanks!

Look at the Emtech zmatch tuner. You can get it already assembled or as a kit. It handles 15 watts which is more than enough for this radio.

1664. CW

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-10 00:04:11 UTC
From: Victor Schensnovich
Topic: 1664 Message: 1664

Hi Charlie,

I work CW only and do not like SSB. What does it mean your phrase "it does have an issue transmittin CW"?
Victor, UA1CEX.

1665. Microphone connector broke

Yahoo group: X1M_QRP-Transceiver (2013)

From: Keith Heimbold
Topic: 1664 Message: 1665

This is probably a dumb question but my microphone connector broke to the 1/8" plug and i don't know which wires to solder to which parts of the microphone. Any insight would be awesome. There is a black, yellow and red wire.

Thanks,

Keith

From: Lee
Topic: 1664 Message: 1666

Different microphones have different colors. Open up the microphone and see which color goes straight up to me microphone element. Mine is red and goes to the plug tip. On miner yellow goes to the microphone element then red would be ring. Far right I had yellow which is not used but connected to the speaker.

Lee - N9LO

PLEASE EVERYONE , In your notes section on your personal settings from the manual in the group files , MAKE A NOTE OF THE COLOR AND CONNECTIONS TO YOU MIC PLUG !!

The mic COLOR CODE is NOT UNIVERSAL !!

Keith I think this mic is wired like this :

WHITE : NOT USED cut back out of the way
BLACK : Long Metal Piece (GROUND)
RED : Center section of plug (PTT)
YELLOW : Plug Tip (MIC)

Here's what the change log lists, do you see anything that seems to be a fix for the CW xmit/recv problem?

Changelog:
1. ATT status display be canceled .
2. ATT switch be canceled in the multifunction key .
3. SPL status display be moved to the original ATT status display location.
4. increase Autokey speed icon and Value indicates.
5. Original ATT switch function in the multifunction key is replaced by Automatic key speed control select function.
6.The bug that If before shutdown, is selected channel mode and the channel number is empty. after power on of the current VFO data will be written to the current empty channel number been Modify.
7.The RIT been amended to only receive valid.
8. Correction for SPL Mode:
8.1 SPL of CW mode: under the CW Mode, must operation Mode of two VFO that all been set to CW, SPL will valid, otherwise it will appear BUG.
8.2 In The operation Mode of the two VFO, all is not under CW Mode, SPL functions are not affected.
9.CW side tone been changed only receive valid.RECV BFO+CW SIDETONE.
10.Default offset of LSB's BFO be modified to -1100Hz (relative the intermediate frequency value),For the EEPROM of the machine already have valid data, after you must to initialize ,it can write the correct data.
If the EEPROM have not writed the correct data , will at first power-on automatically initialized to the correct value.
11.Correction for Speed and Intervals of CW automatic key.

1678. AW: [X1M_QRP-Transceiver] RE: FIRMWARE UPDATE

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-11 06:35:19 UTC
From: Joe
Topic: 1674 Message: 1678

Hi Charlie, Group

Don´t use this Firmware-update!

WIMO tried yesterday to flash two units (X1M Pro), this two devices are now dead!

So stay patient

73 Joe

Here's what the change log lists, do you see anything that seems to be a fix for the CW xmit/recv problem?

Changelog:

1. ATT status display be canceled .

2. ATT switch be canceled in the multifunction key .

3. SPL status display be moved to the original ATT status display location.

4. increase Autokey speed icon and Value indicates.

5. Original ATT switch function in the multifunction key is replaced by Automatic key speed control select function.

6.The bug that If before shutdown, is selected channel mode and the channel number is empty. after power on of the current VFO data will be written to the current empty channel number been Modify.

7.The RIT been amended to only receive valid.

8. Correction for SPL Mode:

8.1 SPL of CW mode: under the CW Mode, must operation Mode of two VFO that all been set to CW, SPL will valid, otherwise it will appear BUG.

8.2 In The operation Mode of the two VFO, all is not under CW Mode, SPL functions are not affected.

9.CW side tone been changed only receive valid.RECV BFO+CW SIDETONE.

10.Default offset of LSB's BFO be modified to -1100Hz (relative the intermediate frequency value),For the EEPROM of the machine already have valid data, after you must to initialize ,it can write the correct data.

If the EEPROM have not writed the correct data , will at first power-on automatically initialized to the correct value.

11.Correction for Speed and Intervals of CW automatic key.

1679. A microphone modification

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-11 08:59:19 UTC
From: Steinar Aanesland
Topic: 1674 Message: 1679

Hi all

This is my first writing to the group, but I have been lurking around for awhile.

After some bad audio reports, I decided to take a look at the microphone. I was told that there was no treble , and that came not as a surprise to me . When I open up the box I found the mic element was hidden up in the left corner without no hole in the front. My voice had to go trough massive plastic . What did I do ? Well, nothing fancy. I removed the speaker and replaced it with the mic element, and now I get very nice audio reports:)

Picture :
https://dl.dropboxusercontent.com/u/16381257/mic.jpg

By the way, I got my radio from http://www.importcommunications.com. Great service :)

Hi Joe , Group ,*PLEASE READ JOE'S MESSAGE . NOT ALL UPGRADES HAVE BEEN SUCCESSFUL . I PERSONALLY HAVE NOT HAD A FAILURE !! BE WARNED !!

PERHAPS JOE CAN ADVISE THE EQUIPMENT IN USE FOR THE FAILED UNITS .
*
I just now flashed an X1M PRO with July 2013 software using the software that WIMO posted and following the list of instructions that I posted to the board . It worked perfectly and upgraded firmware to September 28 2013 V1.01b USA

MY EQUIPMENT USED :
WINDOWS XP PRO
X1M PRO July 2013 Firmware (IMPORT COMMUNICATIONS)
PROLIFIC CHIPSET USB / DB-9 adapter cable (Computer Store Purchase)
ORIGINAL XIEGU TTL INTERFACE (IMPORT COMMUNICATIONS)
(www.importcommunications.com)

*AGAIN PLEASE READ WARNINGS AND JOE'S MESSAGE !!!! (SEE BELOW)

ANYONE ELSE WITH FEEDBACK WOULD BE GREATLY APPRECIATED.

Charlie , W5COV

Here's what the change log lists, do you see anything that seems to be a fix for the CW xmit/recv problem?

Changelog:

1. ATT status display be canceled .

2. ATT switch be canceled in the multifunction key .

3. SPL status display be moved to the original ATT status display location.

4. increase Autokey speed icon and Value indicates.

5. Original ATT switch function in the multifunction key is replaced by Automatic key speed control select function.

6.The bug that If before shutdown, is selected channel mode and the channel number is empty. after power on of the current VFO data will be written to the current empty channel number been Modify.

7.The RIT been amended to only receive valid.

8. Correction for SPL Mode:

8.1 SPL of CW mode: under the CW Mode, must operation Mode of two VFO that all been set to CW, SPL will valid, otherwise it will appear BUG.

8.2 In The operation Mode of the two VFO, all is not under CW Mode, SPL functions are not affected.

9.CW side tone been changed only receive valid.RECV BFO+CW SIDETONE.

10.Default offset of LSB's BFO be modified to -1100Hz (relative the intermediate frequency value),For the EEPROM of the machine already have valid data, after you must to initialize ,it can write the correct data.

If the EEPROM have not writed the correct data , will at first power-on automatically initialized to the correct value.

11.Correction for Speed and Intervals of CW automatic key.

Nice job. On my microphone the slot right above the microphone was open a little but there is a notch from the speaker area to the microphone so the sound comes in the front and is channeled to the microphone off the front of the speaker.

Subject: [X1M_QRP-Transceiver] A microphone modification

Hi all

This is my first writing to the group, but I have been lurking around for awhile.

After some bad audio reports, I decided to take a look at the microphone. I was told that there was no treble , and that came not as a surprise to me . When I open up the box I found the mic element was hidden up in the left corner without no hole in the front. My voice had to go trough massive plastic . What did I do ? Well, nothing fancy. I removed the speaker and replaced it with the mic element, and now I get very nice audio reports:)

Picture :
https://dl.dropboxusercontent.com/u/16381257/mic.jpg

By the way, I got my radio from http://www.importcommunications.com.
Great service :)

Firmware Updates

The recent firmware update was posted prematurely because it still has some bugs. I have had this firmware for a week or more and it has been tested by a few owners including Dale, W4OP. To Dale's credit, he has really tested it out, using equipment that's above most of our pay-grades, especially mine. All X1M owners owe Dale big-time.

For the most part, the firmware fixed several issues. It also created a few of its own. The factory is making corrections and I expect to have a new update in a day or two. I will go ahead and release it when it arrives. I don't believe this next one will need beta testing.

For those that have used this recent release, here is what problems you will see.
The factory is aware of all these bugs and I'm sure they will correct them if at all possible.

1--- Dot/Dash spacing seems to be OK now. But there is still no Dot/Dash memory.

2--- CW speed shown on display is wrong. It is off by 2x. If 10 wpm is shown on display, radio is transmitting at 20 wpm. Here is explanation:

Theory says that WPM = 6 / (5 x Dot Length)
With radio set for 10 wpm, the length of 1 dot is 0.06 seconds (measured by Dale).
So... 6 / (5 x .06) = 20 wpm.

3--- CW Keyer Setting. When radio is turned on, it defaults to 20 wpm. I've told the factory that the radio should remember last CW speed setting and return to that speed when turned on.

4--- Number of memory channels. Original was 100 channels. It is now 32 for VFO A and 32 for VFO B. Total is now 64. I've asked factory to check this.

5--- CW issue. Here is an excerpt from Dale's email to explain what is happening. I have conveyed this to the factory and I hope they understand.

quote: There is still an issue- not major- with the way CW is handled in the IF. I am no genius on this and have not spent a lot of time with it. But here is what I have done. In order to get the freq dial to read correctly in CW Mode I have set the CW BFO to the same frequency as the IF Offset (menu items 1 and 4). The CW Tone then is set to my preference of 500Hz. What setting 1 = to 4 does is center the CW signal in the filter bandpass. Everything works fine. The downside is that you hear both sides of a CW signal- sort of like the direct conversion receivers. This is not great on a crowded band, but is tolerable. One has to remember to always tune the station in on the low freq side of zerobeat in order for you to be on the correct side. If there is another solution- I am all ears. I have not given any thought as to how the firmware could be changed to allow the CW BFO to be set on one of the sidebands, but I know it could be done if we could communicate the concept to the Chinese. For now, it's probably more important to get at least dash memory.

So that's all I know for now. I'm looking for a corrected update in a couple days.

The factory has also said they would furnish an update for the owners of the original X1M radios. With my next shipment, I will get some replacement front panels. If you are the owner of an original X1M and would like to update your front panel to that of the X1M Pro, let me know. It'll give me an idea of how many to order.

Regards,
Ed

The RIT now functions properly . The CW keying issue has been changed and you can work CW with the proper frequencies , although as Ed said , the factory still has some timing issues to do a little clean up on and now the displayed keying speed is not quite correct , which he has made the company aware of now also .Split has been enabled in CW mode .Also the firmware also automatically corrects the factory offset settings now for the different modes .

Basically most issues were related to CW .

Are there any issues related to SSB that anyone is aware of ?

If anyone knows of an issue that Ed did mention as having already been passed on to the factory , PLEASE post ASAP .

It does appear that the next firmware update should resolve ALL KNOWN ISSUES with the X1M PRO.

It is also great to see that front face plates will be available to upgrade the older model to the same firmware level as the PRO .

Now this should be one GREAT rig , with something for everyone !!

Thanks to Ed and Dale .

Firmware Updates

The recent firmware update was posted prematurely because it still has some bugs. I have had this firmware for a week or more and it has been tested by a few owners including Dale, W4OP. To Dale's credit, he has really tested it out, using equipment that's above most of our pay-grades, especially mine. All X1M owners owe Dale big-time.

For the most part, the firmware fixed several issues. It also created a few of its own. The factory is making corrections and I expect to have a new update in a day or two. I will go ahead and release it when it arrives. I don't believe this next one will need beta testing.

For those that have used this recent release, here is what problems you will see.
The factory is aware of all these bugs and I'm sure they will correct them if at all possible.

1--- Dot/Dash spacing seems to be OK now. But there is still no Dot/Dash memory.

2--- CW speed shown on display is wrong. It is off by 2x. If 10 wpm is shown on display, radio is transmitting at 20 wpm. Here is explanation:

Theory says that WPM = 6 / (5 x Dot Length)
With radio set for 10 wpm, the length of 1 dot is 0.06 seconds (measured by Dale).
So... 6 / (5 x .06) = 20 wpm.

3--- CW Keyer Setting. When radio is turned on, it defaults to 20 wpm. I've told the factory that the radio should remember last CW speed setting and return to that speed when turned on.

4--- Number of memory channels. Original was 100 channels. It is now 32 for VFO A and 32 for VFO B. Total is now 64. I've asked factory to check this.

5--- CW issue. Here is an excerpt from Dale's email to explain what is happening. I have conveyed this to the factory and I hope they understand.

quote: There is still an issue- not major- with the way CW is handled in the IF. I am no genius on this and have not spent a lot of time with it. But here is what I have done. In order to get the freq dial to read correctly in CW Mode I have set the CW BFO to the same frequency as the IF Offset (menu items 1 and 4). The CW Tone then is set to my preference of 500Hz. What setting 1 = to 4 does is center the CW signal in the filter bandpass. Everything works fine. The downside is that you hear both sides of a CW signal- sort of like the direct conversion receivers. This is not great on a crowded band, but is tolerable. One has to remember to always tune the station in on the low freq side of zerobeat in order for you to be on the correct side. If there is another solution- I am all ears. I have not given any thought as to how the firmware could be changed to allow the CW

BFO to be set on one of the sidebands, but I know it could be done if we could communicate the concept to the Chinese. For now, it's probably more important to get at least dash memory.

So that's all I know for now. I'm looking for a corrected update in a couple days.

The factory has also said they would furnish an update for the owners of the original X1M radios. With my next shipment, I will get some replacement front panels. If you are the owner of an original X1M and would like to update your front panel to that of the X1M Pro, let me know. It'll give me an idea of how many to order.

Regards,
Ed

Regarding Item #3. I believe if you set the CW speed in the Menu page then it defaults to that speed. Setting it from the operating (normal) page will not be remembered at turn off. This from memory- maybe someone can check me on this.

Dale and Group ,

You are correct Dale . The keyer speed must be changed in the menu (MENU ITEM NUMBER 07 KYR SPD :) for it to be stored in non volatile memory . (It will remain at the speed stored in the MENU when powered off and back on)

If just set from the front panel , it will not be stored on power down .

1699. RE: CW

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-12 00:11:12 UTC
From: <lphebus@...>
Topic: 1664 Message: 1699

Be aware that the plug, a typical stereo headphone jack, has various voltages applied to it by the X1M. In RX mode, the tip (mic input) is about 0 VDC and the collar (PTT) is somewhat over 5 V. In TX mode, the collar is at ground but the tip is at 5 V to drive the electret mic. So use a capacitor to between your computer soundcard and the mic input. Maybe the soundcard has one on its output, but to be sure before injecting audio into the tip. I don't know how you plan to work the PTT, perhaps a simple button or switch would work. I used this circuit for PSK31 nad other digital modes and it worked well
http://www.g4ilo.com/usblink.html http://www.g4ilo.com/usblink.html

Also,be aware the SSB TX filter inhibits the transmission of audio frequencies below about 8-900 Hz. The same signal at 500 Hz has a much lower output Watts than one at 1000 Hz (0.5 vs 5 Watts!). Using a higher tone frequency (1000 Hz) than common in CW (600-700 Hz) will drive the TX more efficiently.

---In x1m_qrp-transceiver@yahoogroups.com, <msharef@...> wrote:

I can try. I use a computer into the mic input. I'll need to make a jumper from my interface card to my friends X1M that he loaned me. I run fldigi. My hands are bad and I don't use a key that much anymore.

Has anyone ever switched the display / front panel / processor / either way , FROM AN ORIGINAL ROUND BUTTON X1M to an X1M PRO /(PLATINUM) , or from an X1M PRO with the blue buttons and new display
to an ORIGINAL X1M with the round buttons ?

Perhaps someone with a factory contact can get and share some information with us about this.

I would like more information , if anyone has it , or can get it , about the new front panel upgrade the company is going to be offering for the original X1M round button edition . Will it just be the same exact panel as is currently on the PRO , or will it be a special item made just for the original X1M's ?

ANY information would certainly be GREATLY appreciated .

THANK YOU ,

Charlie , W5COV

Is there any word on whether any hams suffered any losses and are their hams on the air ?

I know we have at least one ham member from India on this group , that I believe has an X1M . Perhaps he can fill us in on whether or not he used the X1M to help provide emergency or health and welfare traffic . If he did it would be nice to see a write up on his activities .

Very nice radio to have on hand for such events , given it size and FULL QRP output level of 5 watts .

BTW very nice conditions on 10 meters this weekend , so all classes of USA licenses should have had a great opportunity to work many stations , including DX stations today .

IF the conditions on 10 are still good Sunday afternoon , I will be hanging out around 28.400 MHz. looking for X1M to X1M SSB contacts .

Hello,

I connected my USB - TTL unit up to a DB9 today.installed the driver (successfully, according to Windows 7) connected it all up and started HRD then turned my radio on.

I had selected an Icom IC718 as the radio, and all seemed OK until the error message "Cannot find the frequency" appeared.

Has anyone else had this problem? And more importantly, does anyone know of the solution.

I checked the driver with the device supplier and they confirmed I had downloaded the correct one. (there is a later driver on the site, but it is a Beta version only)

Hi Charlie,

Tomorrow is a holiday for me. Please tell me what time in UTC r u planning to be on air on 10M? I will be waiting for u on my X1-M pro version..usually on most mornings my time at about 00:00 UTC, I hear some U.S West Coast stations on 10M n 15M..

Monday morning my time would be about Sunday afternoon US West Coast time..

Hpe to meet u on air..

Check to see what com port Windows assigned to your USB serial adapter and make sure HRD is set to the same.

From: kd5ttz@bellsouth.net
Topic: 1706 Message: 1706

Good morning group.

I am considering purchasing the X1M unit.
I want to use the unit while I am offshore working.
I have looked at several portable antennas and not really sure on what portable antenna I should purchase, I have no experience with any portable antenna. I have looked at the Buddipole, and the Alexloop.

I will be setting the antenna on the Heliport 50x50 iron plate but my issue is that what ever antenna I use, it will have to be extremely quick to assemble, and disassemble, as helicopters can come at any time usually with a 10 minute notification. So quick removal is a must.

The second issue I have is that it's a steel plate, cannot connect any guy wires anywhere, so it would need to be self supported.

I am looking for any recommendations.

Thanks in advance,
KD5TTZ

I use a Superantenna MP-1D for my portable ops (40m-2m). Very quick and easy to set up and take down. I like it better than the Buddistick because you can infinitely adjust the coil just by sliding the coil up or down. Super easy to tune that way and no external tuner is really necessary, always low swr. The included mount can be attached to just about anything with a c-clamp (they do include a small one). They also offer an inexpensive small tripod for portable ops. I think in your case, the basic antenna withe the small tripod would be the ticket for your requirements. The two will set you back about $110 US. I've had good results with the antenna. You can check them out at www.newsuperantenna.com

I have no affiliation with this company, just a satisfied user. Good luck and man, talk about the ideal place to set up a station, a steel island on the ocean! Say hello DX!

From: kd5ttz@bellsouth.net
Topic: 1706 Message: 1710

I have looked at the Alexloop and the reviews are good, however I also read that if you tune 5kc's in either direction you must retune the antenna. Seems like it would take more time tuning than actually using the antenna. I do like the compact design, but not the $$$

I don't do much rag chewing, but I do love chasing the DX. So if I have to retune often, it would take away from the enjoyment.

My comments may or may not be true, this is only what I have gathered from watching youtube video's.

If I am incorrect, please set me straight...
Thanks,
KD5TTZ

Yes if you want the X1M 1st generation..

$250 + shipping of your choice. Includes power cable & microphone but the red knob filler is gone.

This is something all - good - magnetic loops have in common.
Tuning is very sharp and you can hear it quite good by the changing noise level.
So no special thing about the AlexLoop. Price is high, indeed.

Hi Joy ,

I am on the air most days , somewhere , between 12:00 and 17:00 UTC ,
give or take an hour .

Looking forward to contacts with you on more than one band .

After being a ham 48 years I reset all of my logs to zero earlier this
year , like I was a brand new ham , so I need most people that I work
for one reason or another on any mode on any band .

I went to all electronic logging and the X1M about the same time , so
most contacts reflect what the X1M will do .

73, Charlie , W5COV

I'll take a photo of the prototype board. I am flooded with military/aerospace work and have made no more progress since posting the schematic. My apologies.
I use it daily and keep testing. Being audio derived, it will never be as good as RF derived AGC. Still, the output varies less than 7dB now with a 40dB change in input.

Hi Ian,

I got that "X" only because I did not have the X1M connected to the cable.
I did that only to capture the connection window in order to post the image here.
If I had the X1M connected I wouldn't be able to see it since it connects
right away and you wouldnt see it's parameters. I use too a homemade
cable using an USB to ttl adapter in a virtual machine which is a Windows 7 guest Inside
Ubuntu and it works great. The same cable works on my Linux netbook without any driver, no
driver is needed actually.
For Linux users, it works with hamlib, Fldigi and KLog. Thats what I use
When I'm portable.
Yes, you've got to use the serial port your USB-ttl adapter has assigned for you, I think
Lee has said that already.

Subject: [X1M_QRP-Transceiver] RE: RE: New User with HRD problem

Hello, my USB to TTL adaptor has arrived, so now I need to connect it to my
DB9.

I checked the schematic, and can't find what I need so hopefully someone in
the group can assist. The Pins out on the USB converter are identified as...

3V3

TXD

RXD

GND

+5V

Can anyone please tell me which goes to which pin on the DB9?

All help appreciated.

Is it possible to dump the contents of a Channel into VFO so that one can tune around +/- of the stored memory. i.e. M>V? If not, maybe we could do away with the MUT function and have this available?

Lots of DX on 10M today. the 4W out seems to do just fine.

Thanks Lee,

I have 2 options on my Laptop. COM 5 and COM 9

I can see which one I'm using by watching it connect in the device manager.

I have tried both, setting HRD to the relevant one bur still get the same.

I have a new (different) USB-TTL device that I picked up from the PO Box yesterday, so I'll try that today

Thank you all for your advice.I'm sure I'll get there in the end.

Regards,

Ian (VK3YIC)

Hi Dale,

I have not been able to find a way to do this (M>V), and I agree it would be very nice to have. Perhaps do away with ATT, and not MUT? I usually have MUT active, because I don't like the start-up beeps. :)

I have been using mine on 10M also, and I find it great. I get a little under 4W out on 10M, but that's ok with me.

Cheers,

Perrin VK3XPT

Hi again Dale,

I see the latest firmware has removed the ATT - please ignore my previous suggestion! :)

Thanks for the great work you are doing here Dale!

Date: 2013-10-15 23:54:32 UTC
From: <ed@...>
Topic: 1728 Message: 1728

I have ordered some replacement display panels for the original X1M radios (radios with the round red buttons). These replacement panels are exactly like the panel used on the X1M-Pro.

The factory is working on a firmware update for the original radios that will bring them up to the Pro version. Until I have this in hand, I can't guarantee anything but the factory leads me to believe it will make the two radios the same. Of course using this firmware will probably REQUIRE the addition of the Pro-style display panel.

The replacement display panel will probably cost $55-60 shipped. These will arrive in mid November. I will begin taking pre-orders next week.

Hi Charlie & Dale, Thanks for your posts.

I read the "Step by Step firmware upgrade" document and am wondering about the hardware hook-up to the X1M that is needed and how you made the interface. A schematic would be great.

Can I use something like the "Plugable USB to RS-232 DB9 Serial Adapter (Prolific PL2303HX Rev D Chipset)" sold by Amazon which would plug directly into the X1M and I believe has TTL levels since it is powered off the USB.

If so, do I just load up the exe file and it finds the correct port so I can then set the baud rate?

Thank-you!

Glad to see some others are making progress on this. I myself havne't had time to board my chip and do any testing yet. I've been out of town and therefore out of ham playing rnage for a while. I just got back in so hopefully this will be on the top of the play pile soon enough. I first have to resolder my mic connection so I can actually do anything. Now to find my soldering iron after that move....

Subject: [X1M_QRP-Transceiver] RE: Audio Compression 'Accessory Circuit' Idea to Increase SSB Output

I've bread boarded and tested an audio compressor circuit. Pictures are in the "Photos" section. Compression is adjustable from 1:1 to 6.25:1 which seems like plenty to me. It really helps the audio "punch" of the X1M. My plan is to put the circuit in the microphone case with a couple AAA batteries for power. I thought I would use a design like this http://www.qrpkits.com/microphone.html http://www.qrpkits.com/microphone.html . I tried to power it from the +5 volts the socket provides for the electret microphone, but the compressor current draw, although small (<3mA), loaded the 5V down to about 1.7 V. I am surprised by this. The AAA batteries should last a long time however. There are two potentiometers (blue) in the bread boarded circuit. The left is the compression level (Rcomp) and the right is the attenuator adjustment. The output of the compressor chip is a bit too high to feed directly into the X1M.

LOL Maybe that is why I am an old bachelor . My two dogs don't seem to complain at all and I am a true night person so I am not normally even on the net this early in the morning .

I work DX , various digital modes , the part 15 bands , and I am working on a new part 5 license , where the bands are night time bands , plus I have always enjoyed the peace and quiet of the wee morning hours .

If the bands aren't open I ALWAYS have at least one project on the bench that I am building and usually several at the same time .

However since I went to computer logging , I have gone back to using headsets , so my hands are pretty much free to type when I am on phone . One day I may need to add VOX to the X1M . Right now I have a momentary push button in a film can type plastic container to activate the PTT , until I decide what I want to put in a mic interface box for this little gem or see if I can possibly work with smaller SMT devices and squeeze something inside of it. I can go smaller but 1206 are the smallest I am really at ease with and they are fast disappearing from the market .

I bit the bullet and ordered a ssm2167 on a breakout board from them. I decided against soiling my playing with bad soldering fruseration for the moment and instead will forgo the extra coffee one day. I'm thinking and inline version would be the most useful to start out -- plug the mic into the inline box and then have a tail from the board into the rig. There isn't any room in the rig to stick it easily and putting it directly into the mic would limit it to one circuit per mic... also not flexible. The other option is a larger block in the middle of the mic cable but that seems the wrong way.

Anyone have any thoughts on a performed form factor for it?

The more and more I look at this the more and more I want to play with little chip but it is in a tiny tiny MSOP package. And my soldering skills/hand steadiness is NO WHERE near close enough to jump right in. Anyone have a great easy way to put an MSOP chip onto a breadboard or anything like that? I've seen some 'easy' convertors for SMD chips but none for MSOP -- and I guess I haven't looked to see if they would work. Anyway -- if anyone has any great suggestions I'd appreciate it!

Thank Ken! Yup I'm thinking with 5 w I'm going to want the most talk power for the punch of my voice. Although I haven't done the math to see the difference between 0.5w and 5w. if my db brain remembers it probably isn't that much ! much like the difference between 5w and 100w ;) But I suspect it is bigger if I compare 0.5 w to 100w ;) And the goal is to get it as compressed and gained right to point before degrading! And we will see where that lands me! And to top that off the neighbor in the new apartment is really sensitive to me talking at night -- she has come twice at 1am to ask me to keep it down while conversing with a friend at lower than normal voices already. So the more punch I can get out of the mic at lower levels the more I can work in the nighhhhhhht!

And thanks for the thumbs up I'm loving the trip!

Great attitude, Chris! I'm not familiar with that IC, but it sounds as though it has the functions you are seeking. Reasonable compression will add substantially to your "talk power." Like most things, it can be overdone and degrade your signal. Sounds as though you are tackling the learning opportunities this little rig offers with zest and enthusiasm. Have fun and enjoy the trip!
Ken, W1KRT

--- In x1m_qrp-transceiver@yahoogroups.com mailto:x1m_qrp-transceiver@yahoogroups.com, <orders@... mailto:orders@...> wrote:
Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of

the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

Hi John ,

I listed the items that I used in the step by step text guide that I wrote . I was lazy and am building some other projects , plus I am very close to legally blind in one eye and have hand tremors , so I try to avoid doing as much SMD work as I can . (Lee is GREAT at it) .So I did not build my TTL adapter .

I just got my Xiegu TTL adapter from Ed , the short interface cable that was designed for the radio . So I am using that and I have one particular Prolific Chip set that does USB to DB-9 conversion cable that I have always been able to depend on working . I have a couple of other brand ???? from eBay that may or may not work with the right drivers , usually not , so I leave my favorite , reliable one , hooked to my shack computer , running WIN XP Professional and have never had a problem burning the updates .

I can draw a sketch of the cable hookups , but you MUST have some type of TTL adapter between the USB port and the radio !!

Hello Charlie,

Can you please tell me the USB-TTL lead that works with the X1M? and where I can get one?

I bought 2 from eBay .a short PC board (about 2☐ x ½☐)with a USB on one end and 4 pins on the other and a different one USB plug on one end with a 2☐ cable, both labelled TTL

I downloaded (prolific) drivers from site provided by suppliers, but neither of them will read the frequency when plugged into the DB9. I☐m using W7 and have tried it on my PC and my laptop

Regards,

Ian Coots (VK3YIC)

Hi Ian ,

The adapter that you need goes between one of those cables and the radio
. I am certain any Xiegu distributor should have them .

Go to this URL : http://www.wouxun.us/item.php?item_id=306

This is the adapter that I use .

As an alternative , if you wish you can build your own from the group URL :

http://groups.yahoo.com/neo/groups/X1M_QRP-Transceiver/files

Once on this page you will find the very last file is a PDF file named :

X1M_TTL-RS232.pdf
<http://f1.grp.yahoofs.com/v1/xBFfUibYRrUMHYgrL3d9YNMvcVZb1SLPCetCDtY_-O5yIEjhwlDwqqC6KAMN
WxD8LelRHiuyxN2hIBb5YLKLjqZwSKPA2A/X1M_TTL-RS232.pdf>X1M_TTL-RS232

You can build your own from this information . I believe there are also
a couple of other people who have built their own , but I didn't locate
them right off hand .

I'll try to get a sketch up in a little bit . EVERYONE HAS to have one
to be able to upgrade ANY model of the X1M .

ANYONE with an original X1M will be VERY PLEASED to change out to the
new PRO face plate that Ed will have for sale . I have swapped the
PRO face plate to an original and now the original is a PRO . Can't
tell a bit of difference yet , although I am still testing it .

Charlie , W5COV

Hi guys,

As an idea, how about moving A=B to the location (page) that MUT is currently on, and replacing A=B with the proposed M>V button?

I personally never use A=B, and having MD, A/B and M>V on the same "page" would be very useful.

I haven't seen or heard any rumors about this new number rig . Please do
tell us more about it .
I am a little skeptical about adding 6 meters to the current X1M without
some changing of chips and some significant design changes .
Just my opinion , but would like to see if one is in the pipeline ,
since I planned on building a 6 meter transverter for mine this spring .

Thanks for sharing !! Interesting that they will still stay with the same basic designator .

BUT it looks like it is going to not be a good low cost entry level rig .

Anyone heard rumors on a price ?

I do hope they get many of them out there to competent Beta testers for a good period of time before going straight from drawing board to production .

I hope they have learned that they DO need Beta testers and not use their customers as the Beta testers .

Still love the X1M PRO and certainly hope they do not abandon it , but rather do a little expansion on it and people would pay a few buck more for certain enhancements .This radio (PRO) "should" be their bread and butter !!
Does anyone know if they will continue to produce the X1M PRO even IF they get a working model of this radio to market ?

However I "don't think" that people will pay hundreds more for this new model .

Just my personal thoughts and observations .

Says 20 watts . BUT I am curious as to how much the entire radio price would increase .

20 watts is easy to come by if you want to build yourself or there are some kits out there . The difference between 5 watts and 20 watts will likely never be noticed on any contact . It also kind of moves it out of a rig designed for the QRP market , which I am sure moves it into a much different price class .

If you really want to make a difference that you WILL notice , put your money into a better antenna system .
You CAN make a REAL difference that will also help you on receive .

As far as I have followed the discussion in the Chinese forum (Google Translate is your friend!),
it will come with a hefty price tag. About 3 times the price of the X1M Pro. Often misunderstood, but it will NOT be the successor of the Pro!
BTW, I go often portable with some manpack radios and no possibility to use a big antenna. 20 watts is only one S-unit over 5 watts but that can make the difference.

I'll have to see what is being offered these days . Ramsey , Dieter at kitsandparts , Dan at Dans Small Parts , maybe a mini boots kit available . I don't keep up much on kits as I build most all of my own . There are quite a few simple MOSFET amps out there from 5 watts to 100 watts if you want to build your own from scratch and cheap transistors if you smoke one learning to build. I know how to do that quite well . It took me a few transistors to finally tame them . Good thing they are cheap :)

I did translate it , then ended up mainly just looking at the pictures .
Even at twice the price of a PRO I am headed straight to Elecraft .
Sorry I thought that I had seen an X1M reference on the page or part
number. Yesterday was obviously the first time I had even heard of it .
Sad that they don't realize what a gem the X1M could be for them if they
want to make money .

I'll miss out on that one VERY OCCASIONAL contact for 3 times the money :)

Guys this radio is perhaps a year away from production. It will be 20 watts, much larger that the X1M and will be at least >3x the price.

I will get a prototype when available and will release the details then.

Lee,
Thank-you so much for the ebay info on the USB to TTL interface. Sorry to bother you with some questions:

1. Have you successfully used this device to update the X1M software?
2. Is driver is automatically downloaded by Windows?
3. Please provide interface connections you used to male DB9 of red, blu, wht, and blk wires. i.e., blk = pin 5, red = pin x, blu = pin y, wht = pin z.

Thanks Again!
John, W6SB

---In x1m_qrp-transceiver@yahoogroups.com, <cvest@...> wrote:

Hi Ian ,

The adapter that you need goes between one of those cables and the radio . I am certain any Xiegu distributor should have them .

Go to this URL : http://www.wouxun.us/item.php?item_id=306
http://www.wouxun.us/item.php?item_id=306

This is the adapter that I use .

As an alternative , if you wish you can build your own from the group URL :

http://groups.yahoo.com/neo/groups/X1M_QRP-Transceiver/files
http://groups.yahoo.com/neo/groups/X1M_QRP-Transceiver/files

Once on this page you will find the very last file is a PDF file named :

X1M_TTL-RS232.pdf http://f1.grp.yahoofs.com/v1/xBFfUibYRrUMHYgrL3d9YNMvcVZb1SLPCetCDtY_-O5yIEjhwlDwqqC6KAMNWxD8LelRHiuyxN2hIBb5YLKLjqZwSKPA2A/X1M_TTL-RS232.pdf" title="X1M_TTL-RS232.pdf" id="ygrps-yiv-781104226yui_3_10_3_1_1381961930979_2068" style="color:rgb(131, 132, 200);text-decoration:none;font-weight:bold;font-family:'Helvetica Neue', Helvetica, Arial, san-serif, Roboto;font-size:13px;font-style:normal;font-variant:normal;letter-spacing:normal;line-height:20px;text-align:left;text-indent:0px;text-transform:none;white-space:nowrap;word-spacing:0px;background-color:rgb(250, 250, 252); X1M_TTL-RS232

You can build your own from this information . I believe there are also a couple of other people who have built their own , but I didn't locate
them right off hand .

I'll try to get a sketch up in a little bit . EVERYONE HAS to have one to be able to upgrade ANY model of the X1M .

ANYONE with an original X1M will be VERY PLEASED to change out to the new PRO face plate that Ed will have for sale . I have swapped the
PRO face plate to an original and now the original is a PRO . Can't tell a bit of difference yet , although I am still testing it .

Charlie , W5COV

On 10/16/2013 4:54 PM, Ian Coots wrote:

Hello Charlie,

Can you please tell me the USB-TTL lead that works with the X1M? and where I can get one?

I bought 2 from eBay….a short PC board (about 2” x ½”)with a USB on one end and 4 pins on the other and a different one USB plug on one end with a 2’ cable, both labelled TTL

I downloaded (prolific) drivers from site provided by suppliers, but neither of them will read the frequency when plugged into the DB9. I’m using W7 and have tried it on my PC and my laptop

about ATT, my feelings is that it stays "switched on" after downloading of new firmware. And no more possibilities to test or switch it on/off this. Does anybody else have this feeling?
About CW keyer, processor seems work on edge of his productivity and often make delays in keying from paddle.
I dont understand yet, but something do to big delay (more than 500 mSec) in coming back from transmit to receive until normal signal can be listen. Seems charging/discharging of some capacitor of 200 mkF. (Thats in CW)

Hi Dale,

I have not been able to find a way to do this (M>V), and I agree it would be very nice to have. Perhaps do away with ATT, and not MUT? I usually have MUT active, because I don't like the start-up beeps. :)

I have been using mine on 10M also, and I find it great. I get a little under 4W out on 10M, but that's ok with me.

Cheers,

Perrin VK3XPT

Topic: 1727 Message: 1774

Questions to the group members are never a bother. We are here to help each other.

Many programming cables contain Chinese clones of the Prolific USB-to-serial chip. Prolific has "responded" with a poison pill driver that will FAIL to work with a non-genuine chip. I uploaded drivers that will work for XP, Vista, and Windows 7 to a folder called “USB Drivers for Prolific”. There is also a text file explaining install, Windows 7 issues and pinouts. I belong to another group that had the same problems. This question keeps coming up , recently 2 weeks ago, from new users so now we can just refer them to the files section and assist after that.

Subject: [X1M_QRP-Transceiver] RE: New Firmware Update 10-15-2013

Lee,
Thank-you so much for the ebay info on the USB to TTL interface. Sorry to bother you with some questions:

1. Have you successfully used this device to update the X1M software?
2. Is driver is automatically downloaded by Windows?
3. Please provide interface connections you used to male DB9 of red, blu, wht, and blk wires. i.e., blk = pin 5, red = pin x, blu = pin y, wht = pin z.

Thanks Again!
John, W6SB

---In x1m_qrp-transceiver@yahoogroups.com, <cvest@...> wrote:

Hi Ian ,

The adapter that you need goes between one of those cables and the radio . I am certain any Xiegu distributor should have them .

Go to this URL : http://www.wouxun.us/item.php?item_id=306

This is the adapter that I use .

As an alternative , if you wish you can build your own from the group URL :

http://groups.yahoo.com/neo/groups/X1M_QRP-Transceiver/files

Once on this page you will find the very last file is a PDF file named :

<http://f1.grp.yahoofs.com/v1/xBFfUibYRrUMHYgrL3d9YNMvcVZb1SLPCetCDtY_-O5yIEjhwlDwqqC6KAMNWxD8LelRHiuyxN2hIBb5YLKLjqZwSKPA2A/X1M_TTL-RS232.pdf> X1M_TTL-RS232.pdf X1M_TTL-RS232

You can build your own from this information . I believe there are also a couple of other people who have built their own , but I didn't locate
them right off hand .

I'll try to get a sketch up in a little bit . EVERYONE HAS to have one to be able to upgrade ANY model of the X1M .

ANYONE with an original X1M will be VERY PLEASED to change out to the new PRO face plate that Ed will have for sale . I have swapped the
PRO face plate to an original and now the original is a PRO . Can't tell a bit of difference yet , although I am still testing it .

Hi Andris,

as long as there is no attenuator implemented in the X1M Pro that shouldn´t harm.
Do you hear any differences after updating?

Good observation Andy . The X1M has never had an attenuator , apparently it was an early thought that never was implemented.
Did the sound just change on some modes after the update ? Check your original settings against the upgrade , because I believe they did some updates on the settings .

Hi andif62 and Charlie,
now i spend some time and see schematics of x1m and x1m Pro, and wonder. There really is not ATT circuit in it. Now I wonder again - what was the circuit which works on ATT. I confirm that it really works - Both: PRE and ATT do their job as they should do - +/- 10-20 db each, and also show black point, when switced, "on" on display.

May be I have another relese?

About real settings of parameters that is now in device, after upgrade. I see them superfical, and dont see any cahnges. More detailed - late today.

Hallo everybody,
I have posted this in some neighbor topics, but decided open new one.
I have x1m Pro and have sucessfully done Firmware update to v1.01b(Sep 28 2013)
Functionally all new features works and are available.
But radio lost sensitivity and stays noisy - seems like ATT stays switched on.
As You know ATT in new firmware was deleted.
People from neighbor topics told that ATT never had real hardware implementation. Strange, in previous Firmware worked both - ATT and PRE doing their job right (+/- some 10-20 db each!).
Today I see layouts from x1m and x1m Pro, which are there in file section, and really - no ATT circuit made in RX antenna line. What then do ATT button?
May he I have another hardware there?
There was also suggestion - verify all parameters after update. There are only one parameter changed - LSB, which now is 08998850 - and sounds better.

After such long introduction my question - Does anybody else have such strange behavior of receiver?

Hi Andris ,

I have a PRO and an original model that has been tried as a PRO by upgrading the front panel .
I am also running the same version of firmware as you in both radios when they are configured as a PRO.
There never was any difference with the ATT button heard or measured in the receiver since I first bought the radio . It did indeed switch on the display indicating that it was switched in or out , but it seems like it was possibly a thought that never made it to final design to be implemented .

The ATT button is now the speed control for CW SPEED on the keyer in the new firmware .

It is always possible for you to have a different board version , because I know that they do exist , as I have personally seen them on the PRO for sure . You might write down and post the board versions that you have . That is something I failed to do when I realized different components on two different PRO boards . I will do it the next time I come across such a difference . Also pictures of your board posted to the group might be useful.

Are you using a calibrated signal source , since as a signal generator , into the radio for your readings ? I have done the updates as have several others on here and I have not heard of anyone having any receive issues as a result of the upgrade .

10 Meters was open here in the USA over the weekend to many parts of the world and MANY group members were actively working all of the DX , so they weren't complaining of not hearing well on 10 meters .(I think 10 is still open today although I haven't had an opportunity to listen yet)

The LSB change was implemented in the new firmware since the earlier firmware was incorrect and left LSB off frequency right from the factory .

If you want to really dig into any issues that you feel you have , you can always load the older version if you wish to make comparisons and then load back the current firmware when you are done . I DO NOT recommend this , unless you just want to prove there is an issue with your radio caused by the firmware .

I hope others will express their experience , since we are not aware of any such issues . The way the radio has progressed to the point that it is now , is through the feedback of the users in the trenches and the distributors getting that information conveyed back to the factory , that has made it a GREAT little radio , especially for the price !! One

more upgrade which should be the FINAL upgrade and it should be a better radio than most of us anticipated when we bought it .

I don't know ANYWHERE that you can buy a complete radio that will even remotely compare to the X1M for even twice the price !!

I echo Charlie's first paragraph. My X1M pro/platinum has an ATT button that appears to work in the display but does not really do anything to the received signal. I have not yet upgraded firmware.

Hi Andris ,

I have a PRO and an original model that has been tried as a PRO by upgrading the front panel .
I am also running the same version of firmware as you in both radios when they are configured as a PRO.
There never was any difference with the ATT button heard or measured in the receiver since I first bought the radio . It did indeed switch on the display indicating that it was switched in or out , but it seems like it was possibly a thought that never made it to final design to be implemented .

The ATT button is now the speed control for CW SPEED on the keyer in the new firmware .

It is always possible for you to have a different board version , because I know that they do exist , as I have personally seen them on the PRO for sure . You might write down and post the board versions that you have . That is something I failed to do when I realized different components on two different PRO boards . I will do it the next time I come across such a difference . Also pictures of your board posted to the group might be useful.

Are you using a calibrated signal source , since as a signal generator , into the radio for your readings ? I have done the updates as have several others on here and I have not heard of anyone having any receive issues as a result of the upgrade .

10 Meters was open here in the USA over the weekend to many parts of the world and MANY group members were actively working all of the DX , so they weren't complaining of not hearing well on 10 meters .(I think 10 is still open today although I haven't had an opportunity to listen yet)

The LSB change was implemented in the new firmware since the earlier firmware was incorrect and left LSB off frequency right from the factory .

If you want to really dig into any issues that you feel you have , you can always load the older version if you wish to make comparisons and then load back the current firmware when you are done . I DO NOT recommend this , unless you just want to prove there is an issue with your radio caused by the firmware .

I hope others will express their experience , since we are not aware of any such issues . The way the radio has progressed to the point that it is now , is through the feedback of the users in the trenches and the distributors getting that information conveyed back to the factory , that has made it a GREAT little radio , especially for the price !! One more upgrade which should be the FINAL upgrade and it should be a better radio than most of us

anticipated when we bought it .

I don't know ANYWHERE that you can buy a complete radio that will even remotely compare to the X1M for even twice the price !!

Functionally all new features works and are available.
But radio lost sensitivity and stays noisy - seems like ATT stays switched on.
As You know ATT in new firmware was deleted.
People from neighbor topics told that ATT never had real hardware implementation. Strange, in previous Firmware worked both - ATT and PRE doing their job right (+/- some 10-20 db each!).
Today I see layouts from x1m and x1m Pro, which are there in file section, and really - no ATT circuit made in RX antenna line. What then do ATT button?
May he I have another hardware there?
There was also suggestion - verify all parameters after update. There are only one parameter changed - LSB, which now is 08998850 - and sounds better.

After such long introduction my question - Does anybody else have such strange behavior of receiver?

Topic: 1535 Message: 1785

I just posted a JPG of a master board for the AGC boards. Each master contains 16 AGC boards. Each individual board is 0.625" X 0.95" and is plated through, silk screened and solder masked. They will be here Thursday or Friday. If anyone wants a bare board let me know. I'll place an order for parts tomorrow- enough for 30 kits initially.
W4SC is a very talented engineer and after some arm twisting I got Ben to do the SMD layout for us. A very elegant board.

The final circuit was the 3rd of a series I breadboarded. It is by far the simplest and yet works the best of the three. Performance appears to be pretty close to what might be achieved by RF derived AGC. I have been running this final version for several nights now and it works better than I had expected for audio derived AGC. I hope the members will be as pleased as I am. AGC is a very complex subject fraught with problems I never knew about or anticipated; and interfacing to the X1M raised additional issues. The board requires 4 connections to the X1M: +9/GND/AF IN/ AGC OUT. There is a SMD pot on the AGC board that will allow each user to select his own threshold point.

Hallo Charlie,

thanks for such long answer on my question.
Nice to see there frendly people. I am Ham for more than 40 years. And have listened lot of receivers, from tube ones to one chip made. I see that You also have praxis not only in hardware, but also in sales.
In my receiver seems something now, after upgrade have not made good contact. My first thing was - it is ATT, but now i think it can be something else - halfly switced diode or not right connected circuit - from processor. I see that others have not this, and I should solve my problems locally.
I put on tale standart signal generator and try find where fault is.
Yes, last sunday I listen on 10 meters and band was widely open.
Have a nice evening, and DX

hallo onionman51,
thanks for replay.
It was interesting, I even think for returning of update back to previous one and see/ measure with standart signal generator the influence of ATT on/off.
At this moment I feel that something is not swthced or is halfly swtched in radio tract. This rises noice and low sesitivity.

I just posted a JPG of a master board for the AGC boards. Each master contains 16 AGC boards. Each individual board is 0.625" X 0.95" and is plated through, silk screened and solder masked. They will be here Thursday or Friday. If anyone wants a bare board let me know. I'll place an order for parts tomorrow- enough for 30 kits initially. W4SC is a very talented engineer and after some arm twisting I got Ben to do the SMD layout for us. A very elegant board.

The final circuit was the 3rd of a series I breadboarded. It is by far the simplest and yet works the best of the three. Performance appears t o be pretty close to what might be achieved by RF derived AGC. I have been running this final version for several nights now and it works better than I had expected for audio derived AGC. I hope the members will be as pleased as I am. AGC is a very complex subject fraught with problems I never knew about or anticipated; and interfacing to the X1M raised additional issues. The board requires 4 connections to the X1M: +9/GND/AF IN/ AGC OUT. There is a SMD pot on the AGC board that will allow each user to select his own threshold point.

MDS is Minimum Discernible Signal.
Have you done my mod to the LM386 chip to raise system gain by +12dB? If not, you need to do that first- it just involves shorting out R80C.
Once you have done that, put a calibrated sig gen into the antenna input. I can hear -130dBm on my unit on 80M- Preamp enabled.

Subject: [X1M_QRP-Transceiver] RX lost sesitivity after Firmware update

Hallo everybody,
I have posted this in some neighbor topics, but decided open new one.
I have x1m Pro and have sucessfully done Firmware update to v1.01b(Sep 28 2013)
Functionally all new features works and are available.
But radio lost sensitivity and stays noisy - seems like ATT stays switched on.
As You know ATT in new firmware was deleted.
People from neighbor topics told that ATT never had real hardware implementation. Strange, in previous Firmware worked both - ATT and PRE doing their job right (+/- some 10-20 db each!).
Today I see layouts from x1m and x1m Pro, which are there in file section, and really - no ATT circuit made in RX antenna line. What then do ATT button?
May he I have another hardware there?
There was also suggestion - verify all parameters after update. There are only one

parameter changed - LSB, which now is 08998850 - and sounds better.

After such long introduction my question - Does anybody else have such strange behavior of receiver?

Yes, I should have done it first. I went from relatively complex circuits and ended up with an op amp gain stage of around 10, a half wave rectifier with controllable attack/delay characteristics and a voltage follower. It turns out on the X1M, for some reason (which I had no interest in investigating at this time), the AGC voltage on the MC1350 effects SSB output power. So the final step was a series resistor on the output of the voltage follower to the MC1350 AGC pin.
In this case, simpler was better.

Hey Andris ,

I too have been a long time ham . Next month will be my 48th anniversary
of the date that I was first licensed.

Sorry about the long answers . This group has become like family to me
with so many people willing to help each other.

I apologize if I stray toward promoting the radio , even though I have
no financial or other similar connections to anything related to the radio .

However I haven't bought a new HF transceiver in many years , and when
one this small and was a full fledged 5 watt QRP already built
transceiver came on the market for the low price , when compared to
other rigs here , it did excite me to see the little rig and now what
all that it will do . Like you , I am sure not much excites you that
comes on the ham market today after so long in the hobby , this radio
DOES excite me !!

You will never believe I initially bought the radio to use as an exciter
only for my experimentation on the MF/LF bands , since it will transmit
down to 100 kHz. and is excellent as an IF radio for my transverters for
74 kHz.

If we can be of any help with your issue , we certainly will be happy to
try . There are many people on here with a lot of knowledge about this
radio and electronics in many different fields .

Best 73 ,

VERY nice simple and clean circuit Dale !! THANK YOU very much for all
the time and effort that you put into this modification .
I am looking forward to installing one and do some serious QRP operation.
LOTS of great CW and phone contests coming up in the next couple of
months and I am going to give the little X1M PRO a good workout in all
of them that I can find time to operate .
The AGC will make a BIG difference in setting the receiver where it is
consistently comfortable to listen to .

1800. RE: RX lost sesitivity after Firmware update

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-22 18:10:58 UTC
From: <yl2fd@...>
Topic: 1781 Message: 1800

Hallo everybody again.
Folks forgot about ATT, this was not reason (and cannot be) for losting of sesivity.
My x1m do the strange things.
Today dissapears side tone of CW in loudspeaker (and head phone too). Testing of output signal shows that really signal goes in antenna, thats mean dissapear beeper. First thing was tuning of trim pot for side tone volume. In begining it was very - very loud, an I tune it practicaly to left right position for normal signal. After dissapering of beeps I open box, and - RX start working normally!
Thats great, but beep dont appear. Now I am working for two cases:
1) looking for beep, and signal CWtone from processor (pin 23 and C3B :)) May be processor is not working it out. and,
2) what is the reason of my previous noisy and nonsensitive RX. This can be some contacts, that comes weeker during tighting of screws of case. I can not reach this once more and this is bad for diagnostics.
Besides this I made CW QSO with station of some 3000 km from me on 40 m band with 3.5 W average out, (measured by osciloscope on 50 Om resistor).
Antenna GAP Titan Dx, Tuner was switched out.

Nice Charly,

thanks again for answer. You are right - we are family, HAM is joining lot of people.
See, I have some changes in situation with low sesitivity of my Rx. I have posted this some minutes before.
As to mee - I like CW qso's. But I have another interest too - tube radio. I have collection of near 100 of them, both communication receivers and broadcasting too.
I am from Latvia, Riga, and we have 2 radio factories there. And semiconductors, and analogue IC was made there. Now this is gone due to technology changes. I have in my collection all "post War" (1945) tube receivers that was made in Riga till end of tube receiver production there. And only some of them are not working :)
Have a good day!

Hallo Charlie,

thanks for such long answer on my question.
Nice to see there frendly people. I am Ham for more than 40 years. And have listened lot of receivers, from tube ones to one chip made. I see that You also have praxis not only in hardware, but also in sales.
In my receiver seems something now, after upgrade have not made good contact. My first thing was - it is ATT, but now i think it can be something else - halfly switced diode or not right connected circuit - from processor. I see that others have not this, and I should solve my problems locally.
I put on tale standart signal generator and try find where fault is.
Yes, last sunday I listen on 10 meters and band was widely open.
Have a nice evening, and DX

Hi Andris ,

I have a PRO and an original model that has been tried as a PRO by upgrading the front panel .
I am also running the same version of firmware as you in both radios when they are configured as a PRO.
There never was any difference with the ATT button heard or measured in the receiver since I first bought the radio . It did indeed switch on the display indicating that it was switched in or out , but it seems like it was possibly a thought that never made it to final design to be implemented .

The ATT button is now the speed control for CW SPEED on the keyer in the new firmware .

It is always possible for you to have a different board version , because I know that they do exist , as I have personally seen them on the PRO for sure . You might write down and post the board versions that you have . That is something I failed to do when I realized different components on two different PRO boards . I will do it the next time I come across such a difference . Also pictures of your board posted to the group might be useful.

Are you using a calibrated signal source , since as a signal generator , into the radio for your readings ? I have done the updates as have several others on here and I have not heard of anyone having any receive issues as a result of the upgrade .

10 Meters was open here in the USA over the weekend to many parts of the world and MANY group members were actively working all of the DX , so they weren't complaining of not hearing well on 10 meters .(I think 10 is still open today although I haven't had an opportunity to listen yet)

The LSB change was implemented in the new firmware since the earlier firmware was incorrect and left LSB off frequency right from the factory .

If you want to really dig into any issues that you feel you have , you can always load the older version if you wish to make comparisons and then load back the current firmware when you are done . I DO NOT recommend this , unless you just want to prove there is an issue with your radio caused by the firmware .

I hope others will express their experience , since we are not aware of any such issues . The way the radio has progressed to the point that it is now , is through the feedback of the users in the trenches and the distributors getting that information conveyed back to the factory , that has made it a GREAT little radio , especially for the price !! One more upgrade which should be the FINAL upgrade and it should be a better radio than most of us anticipated when we bought it .

I don't know ANYWHERE that you can buy a complete radio that will even remotely compare to the X1M for even twice the price !!

Hallo everybody,
I have posted this in some neighbor topics, but decided open new one.
I have x1m Pro and have sucessfully done Firmware update to v1.01b(Sep 28 2013)
Functionally all new features works and are available.
But radio lost sensitivity and stays noisy - seems like ATT stays switched on.
As You know ATT in new firmware was deleted.
People from neighbor topics told that ATT never had real hardware implementation. Strange, in previous Firmware worked both - ATT and PRE doing their job right (+/- some 10-20 db each!).
Today I see layouts from x1m and x1m Pro, which are there in file section, and really - no ATT circuit made in RX antenna line. What then do ATT button?
May he I have another hardware there?
There was also suggestion - verify all parameters after update. There are only one parameter changed - LSB, which now is 08998850 - and sounds better.

After such long introduction my question - Does anybody else have such strange behavior of receiver?

Can I get a rough show of hands as to how many might be interested in adding AGC to their X1M PRO's?

Once the design is finalized, I'll order boards and SMD parts. I envision the board as being smaller than a postage stamp and affixing to the top board via @X tape directly behind the LM386 IC. You will have to lift pin 5 of the MC1350 and make 4 connections- GND/VCC/ Audio In/AGC out.

Tnx,

I placed an order with Digikey for parts to build 40 boards. I'll build a couple of the boards and test them. Then, if all proves OK, we'll start kitting them up. The assembly manual will be available on the PAR Electronics WEBsite and here on the Yahoo Group. I am estimating the kit will be under $13 including USPS CONUS shipping. I'll have more data on international order shipping as soon as I can find time.

Dale,
just now i saw layout, and have two questions.

Tuning of output voltage seems should be done by R1, not R2, as shown in layout?
where is the point of measuring of 4.17 VDC - Pin 5 MC1350 (W4)?

Hi Andris,
I am sorry, I don't have much time to answer individual questions right now. R1 sets the no signal voltage as measured on Pin 5 MC1350. Some part numbers have had their designation changed. R1 is the threshold adjust pot.

I just posted a JPG of a master board for the AGC boards. Each master contains 16 AGC boards. Each individual board is 0.625" X 0.95" and is plated through, silk screened and solder masked. They will be here Thursday or Friday. If anyone wants a bare board let me know. I'll place an order for parts tomorrow- enough for 30 kits initially.
W4SC is a very talented engineer and after some arm twisting I got Ben to do the SMD layout for us. A very elegant board.

The final circuit was the 3rd of a series I breadboarded. It is by far the simplest and yet works the best of the three. Performance appears to be pretty close to what might be achieved by RF derived AGC. I have been running this final version for several nights now and it works better than I had expected for audio derived AGC. I hope the members will be as pleased as I am. AGC is a very complex subject fraught with problems I never knew about or anticipated; and interfacing to the X1M raised additional issues. The board requires 4 connections to the X1M: +9/GND/AF IN/ AGC OUT. There is a SMD pot on the AGC board that will allow each user to select his own threshold point.

G'day Lee,

I thought I'd let you and other users that may be following this post know, that following your post re: the "poison pill" Prolific drivers, I checked to reveal my driver was a 12/09/2013 version.

I downloaded the drivers you provided, replaced mine and checked again. The replacement driver now has the date 31/07/2007 (sorry.Australian format for date) So I'm guessing that for W7 that is probably the first version.or close to it.

The trouble is it still will not read the frequency from the X1M for either of my two very different USB to TTL converters.

I wondered if anyone else is still having the same issues, and if there is a simple test to ensure the DB9 is functioning correctly on the X1M?

Regards,

Ian Coots (VK3YIC)

1812. Any Digital Home brew interface operators ?? HELP NEEDED !!!

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-23 05:52:28 UTC
From: Charlie , W5COV
Topic: 1812 Message: 1812

Hi Group ,

We all have different interests and different priorities , as well as different budgets and abilities . That is one thing that makes this such a good group is the wide range of skills and people willing to help other people , without having to reinvent the wheel .

There are a number of nice little accessories that we can begin to build a library of , now that we are so close to the final firmware version .

I am a VERY avid designer , builder , experimenter , and operator , BUT my main priority is DC-2MHz. I run a USA part 15 beacon on 1750 meters , which is limited to 1 watt INPUT and an antenna that can not exceed roughly 50 feet , including ground lead . Quite challenging to say the least . I normally operate QRSS60 on 185.2984 kHz. and my identifier is CV .The "season" for this beacon is just beginning and I need to do some work on my station , especially the antenna , so I can hopefully put it on the air running 24/7 in just a few days and leaving it on all winter .

Okay the point of my post . I have had several inquiries by private e-mail and I do welcome hearing from anyone and if they have a question that I can answer , I am more than happy to answer it or try to find an answer for it if I don't know the answer.

I have had quite a few inquiries about using digital modes through the microphone jack with the X1M . I know for sure Paul is an active digital operator and I am too at different times of the year . I have a SignaLink USB interface , with the built in sound card , as well as a Buxcomm and a RIGblaster , from West Mountain Radio , along with a couple of simple , basic , cheap , down and dirty , no frills , home brew interfaces. Those are usually used with some of my many pieces of tube type radio gear , which I normally run RTTY with .

Several people from the group want to get involved in digital operation . Some with a limited budget , some not so limited . I played around a little with the SignaLink and the X1M early on , since it is the easiest interface to set up and get working , at least for me on the X1M. Some people want something cheaper and more basic and will be depending on the computer to set the audio levels and thus the power output . REMEMBER these are HIGH duty cycle modes , so NEVER run FULL output and be EXTREMELY mindful of your TRANSMIT duty cycle . A little extra cooling , probably wouldn't hurt either .

If you are running a home brew device that is built from readily available parts that are not too expensive , PLEASE consider posting a diagram , for others to be able to duplicate and have a high degree of success for beginning operators , perhaps even building their first

project from scratch . A simple yet complete and informative diagram , INCLUDING the microphone jack wiring , I am quite certain from the e-mails that I have received would be GREATLY appreciated by many of the group members . A good schematic and bill of materials , plus parts suppliers used would be even better .

Perhaps also a basic tutorial on operation for a few of the more common modes would help also . Maybe even a wave file or two of some of the most common modes , like PSK31 , would aid a new person in identifying what to listen for .

Also anyone that has a favorite piece of software and can add a description of how to get started with it would be another HUGE plus . A couple of different pieces of software and basic instructions would let them decide what they like best . They can always upgrade to a different program once they get some experience . Hopefully we have a couple of people that prefer different pieces of software . I have only recently started to change to FLDIGI myself from Digipan. (FREE SOFTWARE IS A NICE PLUS FOR MANY members also)

Remember we have MANY new ham users that are buying this radio , so as simple and easy as we can make it , the better . If you have questions PLEASE post them to the group . Even many seasoned operators can learn some new tricks or shortcuts along the way . I will likely have a question or two , once I have time to play more with FLDIGI and using it with the X1M . You never get to the point that you know it all and there are no stupid questions , only stupid mistakes , by not asking .

THANK YOU IN ADVANCE to those of you that will offer your support and help and hopefully post some diagrams and basic information sheets in the files for everyone to use . I will contribute too once I get caught up a little .

Best 73 , Charlie , W5COV

Hi Charlie & Thankyou!

I principally bought the X1M for PSK so it won't be long until I come up with an simple interface, and, I am not going to use the SignaLink interface. It would be helpful to know:

1. The spec for a full modulation input voltage (i.e., x millivolts rms).

2. If the microphone input needs a bias resistor to ground (to simulate the microphone).

3. If the microphone input needs to be capacitively isolated from the the interface. I assume yes.

The schematics I have for the X1M apparently do not show the microphone interface (they show where the microphone jack but not the interface to the X1M).

Hi charlie,

My xm1 is still in the USA and i am not sure when i will get it. My main reason for buying it is for QRSS so i will be making an interface for it and use some species of microcontroller for controlling the tx. Demands on my time have just leapt as i have decided to move house and country next year. So i need the proverbial round tuit made from unobtanium to fit everything in. Priority is the microcontrroller course i am writing and have fallen way behind on.

Keep up thegood work,,

Amen,
I know some of this information exists in under files but putting it all together in one folder would be great. Putting it up on wiki would be even better.

I would like to see details on all the recommended interface hardware (with pin-outs) and software: a recommended USB to TTL converter (or equivalent pieces) to the X1M DB9 connector plus the software drivers with latest and tested X1M firmware. Pin-out information from the TTL interface device to the X1M needs to be included. It would be nice if all the hardware came with links to one place like Amazon.

For those of you that have already done this I would be willing to collect what you have done and make it available to the group ~ otherwise would your please post the hardware / software configuration that you used to update the firmware?

Thank-you!
John, W6SB

The circuit diagram for the SignaLink USB interface shows isolation transformers in both input an output sides. It works "plain vanilla," just connected to the microphone jack for input and PTT, and output from the audio jack on the back with a stereo jumper. I tried my MFJ-297 microphone, but it was clear I needed an DC blocking capacitor, at least. I haven't pursued that matter further, as my X1M is back to Ed for replacement with the next production run (no output on 10, low on 15 and 20 meters). Just control the modulation level with the TX knob on the SignaLink unit. I set it so that I would get output on my SWR meter about 25% of full scale, full scale being "key down" on CW. That seemed to have worked fine. I just used 1/2 of an Ethernet cable, and the stereo plug that was shipped with the X1M.

Hi Paul

I got a SignaLink USB interface and would like to try to connect it to
my X1M.

What you are doing is something like this ?

Hi friends, today, I got X1M Pro. I programmed chanels for each band.
But when I choose a chanel, I cannot tune freq. around it. I tried press
button V/M, but no result. I think, I did something wrong. What I should
to do?
Victor, UA1CEX.

We have asked for the ability to dump a memory channel into the VFO on the next firmware upgrade.

Hi Stephen ,

Sounds like you are quite busy . I know when you get your X1M and have time that you will be contributing projects to the group .
I am trying to get the LF QRSS gear set up and ready to run for the entire winter . My antenna work has been delayed until just being able to start on it last week and as cold as it is here this morning I know the LF season is already upon us .
Looking forward to more on your course when you have time .

There is a step by step version that I wrote up. It is in the file area . They have upgraded the program a little so that some buttons are in English on the latest firmware upgrade . Just be sure to leave your radio turned OFF until the instructions tell you to turn it ON . If you have any specific questions , please post them as I have done quite a few upgrades . It takes about 5 minutes to do a radio . It also has to be the PRO .

I'll try to take pictures and do a better write up . I have trouble taking pictures , due to having to hold the camera once the picture is snapped , since I have Parkinsons like hand tremors .

If someone that is having a problem and wants to make a video of their attempt to upgrade , then I can perhaps view it and help you with your problem . I still haven't had either of my "modern 21st century granddaughters" come down and show me how to make a video :) If I can figure it out I will try to make some kind of visual aids .

I have never had one upgrade fail right from the first one . Paul is a talented writer , but waiting on a radio right now . Perhaps he can look at my step by step instructions and clean them up a little , since I am not such a talented writer at explanations .

Hi John ,

Here is some basic information that should help you get going with the
mic issue for digital work :

http://groups.yahoo.com/neo/groups/X1M_QRP-Transceiver/files/Mods%20and%20Reviews

How to connect a PC Headset mic to X1M.jpg
<http://f1.grp.yahoofs.com/v1/EAhoUlnoY69rwT3np6juUUXp8mAHStD1fEvzJL3w108g4d3DT2syU51Yfl9_sJYLYiAMm_8K2nFvE-NbI185evZDG_ysSA/Mods%20and%20Reviews/How%20to%20connect%20a%20PC%20Headset%20mic%20to%20X1M.jpg>

Naturally to receive digital modes , all that is needed is a cable
between the X1M headphone jack and the sound card .

Perhaps tonight I can wire one of my old non isolated basic bare bones
no frills transmit interfaces , that just requires a minimal
number of common parts , up to the X1M .

I DO prefer isolation so as not to have to battle ground loops ,
especially for people new to interfacing external devices to this
or any other radio , radio/computer equipment .

Essentially. I use my SignaLink USB interface for both the X1M and an Alinco DX-SR-8, both of which have to be fed through the microphone jack on the front of the transceiver. To simplify matters, I used the same "connect to radio" configuration, so that I don't have to change jumpers -- it is configured for the Alinco -- only need FOUR wires -- Mic, Mic Ground, PTT, and PTT ground. Audio from radio (both the Alinco and the X1M) is fed directly to the audio jack on the SignaLink, and DOES NOT go through the RJ-45 connection, which would lead to a messy external spice, unless you have a crimping tool for RJ-45 connectors. I simply got a nice flexible Ethernet jumper -- 1 meter (~ 3 feet), and cut it in half and connected it to the stereo plug shipped with the X1M. I had some nice short stereo jumper for the audio from either the Alinco, or X1M. I wanted to keep things simple and neat.

One more thing -- again, to keep things SIMPLE, I used the HRD/DM780 suite -- to control the X1M *AND* for digital modes. I have also used MMSSTV for receiving SSTV with the X1M, though, at 5 watts, that is a little weak in the knees for reliable SSTV transmissions.

The use of HRD is discussed on page 6 of the User's Guide. The pin out for the X1M microphone connector is discussed on page 7. The general discussion for the SignaLink is discussed in the on-line manual for the SignaLink USB interface. Your choice on how to hook up digital cabling.

There are only THREE considerations:

PTT (which is the nice thing about the SignaLink interface)
Audio FROM the radio (isolation transformer in the SignaLink)
Audio TO the radio (isolation transformer in the SignaLink)

The SignaLink does NOT require a digital interface on the radio. If you have one, nice, but it can be used on essentially any SSB transceiver. The PTT is done with a nice relay, but I wouldn't do cathode keying on a tube radio!

1831. FIRMWARE UPGRADE CABLES PICTURE

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-24 00:12:55 UTC
From: Charlie , W5COV
Topic: 1831 Message: 1831

I have just uploaded 4 pictures of the firmware upgrade cables that I use . They are shown hooked to the radio.It is in an album named Cables .Don't know if this will help or not , but if you want or need more details , I'll do my best to provide them .

If you have something that you have home brewed or adapted for this rig , please share it with the group. I can think of a lot of neat little accessories to add and likely other people have similar thoughts .

When time returns to build more accessories I am divided about which to build first , an antenna tuner (manual) or a filter box , to use it on other bands . Both are on a list somewhere along with a few other things .

Dale has shared his AGC accessory and I think maybe two Lee's have shared their processor circuits .

These people have done an EXCELLENT job , in making them where they fit inside of the radio and its components and you can not visually see any difference to the radio.

Paul has done an excellent job of making up the cable for and explaining how to interface the SignaLink USB for digital modes .

We are blessed to have so many talented people willing to share their time and experience designing these nice little extras .

Just worked VY1MB on 28480.3 MHz @ 20:35 UTC.

59 into EPA.

Broke thru the pileup with K2 @ 5w & beam.

1835. My first winmor with X1M

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-24 21:10:42 UTC
From: Steinar Aanesland
Topic: 1812 Message: 1835

Hi all,

I had my first winmor connection on 80m with my X1M pro this evening
(Connected to LA3F on 3595.000 CF).

I used my Signalink USB and my home-made cable. It worked perfectly :)

LA5VNA Steinar

1836. 30m?

Yes it is . I built a filter for mine and have used it there and also
built a filter for another group member for 30.

1840. FILTERS FOR OTHER BANDS

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-24 21:50:04 UTC
From: Charlie , W5COV
Topic: 1840 Message: 1840

If you want to "roll your own" , or build a kit version filter here are a couple of links for quick reference . They come from Hans Summers web page . I plan to build a box of filters with a rotary switch for the bands from
2200 meters through 12 meters . Just for the bands that are not one of the 5 bands already included in the radio.

http://www.gqrp.com/technical2.htm Good reading and values for the common bands . A handy reference.

http://www.hanssummers.com/lpfkit.html Filter "Kits" that also include 2200 meters and 600 meters .

Also here is a FREE , really great calculator for rolling your own and you can use as many or as few elements as are required . WELL worth learning to use , if you do ANY building !! http://www.aade.com/filter.htm

Insert between the radio and the antenna . Pay attention to power if you will exceed QRP levels .

Again NO FINANCIAL OR OTHER INTEREST & the first page has been around for many years and published in various publications . Just hope it will help you get even more use and enjoyment out of your radio !!

Hi,
I have a X1M Pro and am looking to do some portable operation. I'm in the US.

1) I'd like to get a LiPo battery pack and wall charger similar to the ones shown by VK3TWO in his videos.

2) I'd like any thoughts on a solar panel and charging set up for emergency use.

Thanks
Jeff

I too am interested in seeing what batteries or battery packs and chargers / charging methods are being used especially by portable operators . AC Mains / Automobile Charging systems / Solar / Wind , all different methods .

Also interested in the home made antennas that are being used for lightweight portable operations .

All of my operation so far has been from one form or another of an AC Mains powered supply .

Also ANY little hints or tips / projects / products that people are adapting to use with the X1M .

Hi,

Here's the battery I'm using with my Elecraft KX3. While it's more expensive maybe than some might want to pay, it lasts a long time, and it's rated for like 2,000 charge/discharge cycles, and lifepo batteries have a low self discharge and deliver their full power out for a long time.

I bought a pair of the batteries ebay item # 280955387622 and charge controller ebay item # 321133970797. I bout a pair of 10 watt 12 volt solar panels and put hinges on them so they fold like a book to protect the surfaces when stored. I’m thinking about buying a pair of 20 watt panels and do the same. Best prices I could find anywhere. Please let me know if you find cheaper and I’ll get my 20 watt panels there.

I would just caution those that are interested in solar panels that there are at least two main constructions-
monocrystalline and amorphous. A lot of the inexpensive panels are amorphous. The downside of these panels is that the efficiency declines with time.
Depending on your use, you may be better off to pay a bit more and buy the crystalline structure panels.

Well I am the President of that outfit, BTW I spoke a bit to soon. Went to lunch came back and now have no audio. Something amiss for it to be so good one time and now after 20 tries I can sometimes get muffled audio and very very light. Something amiss time to look inside.

Anyone with experience with that problem drop me a note. I started with a HW101 I don't plan to be broken by this little thing.

I'm just about to finish a "project box" and will post details and a photo when I have completed and tested it. It contains a PC power supply for mains operation, a 12V lead acid battery (I already had this so didn't want to buy a LiPo and additional charger,) my X1M , and an MFJ-971 antenna Tuner/SWR meter. It has the facility to charge the battery by solar panel or battery charger. I wanted something I could use on the bench at home, or take in our caravan for portable use. My portable antenna is an end fed wire antenna mounted vertically on a 10 metre fibreglass squid pole. I hope to have this completed and tested within the next 2 weeks and will advise outcomes... positive or negative then.

I have discovered a symptom that may be firmware related. If I turn the X1M off for about 10 minutes and turn it back on it comes on with audio. But otherwise if I attempt to recycle I get a display flash and then the display lights on and but no audio. Once this event occurs then I have to turn it off and wait several minutes. I have yet to remove and reinstall the front panel.

I saw a good review of these in Popular Communications

http://www.daysaver.com/ProductDetails.aspx?pid=8fbfe091-c5f0-4287-ba84-97aee18d077f
http://www.daysaver.com/ProductDetails.aspx?pid=8fbfe091-c5f0-4287-ba84-97aee18d077f

Expensive but only 2 pounds for a 14 AmpHr 12 volt rechargeable with a lithium-based chemistry that won't catch fire. Similar SLAs would weigh maybe 14 pounds. Very soon they will also sell a 19 AmpHr ~7 pound version with fast recharging. Both can be recharged with regular 12 volt chargers and solar charge controllers (so the manufacturer told me).

Mine is a linear device and I have had no problems at all with noise . I haven't tried a switching supply yet , but suspect that it will require some additional filtering . Mine is also 2 Amps .

I got lucky the first power supply that I pulled out of my "junk box" was the correct ratings and even had the correct plug on it !!

I am not sure how large of switching supplies that I have around here in my Wal Wart or (laptop) computer power supply box .

I am pretty sure some list members have done a little conversion on a switching type and are using it with success .

John , can you add your input on this , since I think you use a modified switching supply ?

I've been out of the loop for a while- my wife broke her leg and I've been doing "honey-do's". Just updated firmware Thursday and have played with it some. Nice! When I press and hold F5 I get the info about version number, etc, but no serial number for the radio. Has this information been deleted ? Is it found elsewhere? I will put a sticker on the back of my X1M to brand it as mine, but I liked having the serial # in firmware. Have I missed something? Thanks.

Likely yes, and also you must use a peak reading wattmeter for SSB.

Are you referring to the audio gain mod? On my schematic it is labled R80C- but there may be more than one schematic out there. The value is 1K- it is on the bottom of the top board. Use an multimeter to confirm its connection to Pin 1 of the LM386. It is easiest to place your jumper from Pin 1 to the (+) side of the electrolytic which is C155C on my PRO schematic.

From: <parinc1@...>
Topic: 775 Message: 1869

Our boards got delayed by a day- this means the weekend in this case.

For those that will be ordering:

1. The parts are all SMD; 0805 size so easy to work with.

2. You will need a pair of excellent quality flush cutters to be able to cut and lift Pin 5 of the MC1350. Don't try this with a poor quality pair of cutters or you will end up replacing the IC.

3. You must first do the 12dB audio gain Mod I described several months ago.

4. The only item not included in the kit is a small piece of double sided foam tape- Lowe's and Home Depot both carry it here in the states.

5. I am working on the short manual and will post it as soon as I can.

6. I went from a quad op amp IC to a dual op amp IC so the S meter will have to wait although the connection we need to the outside world is available on the board.

7. Some may be uncomfortable with SMD building. If there are builders willing to assemble the board, let's post to the Group. But also be aware that installing the AGC board also requires expertise working with small spaces and components.

1874. X1M AND AN EXTERNAL SPEAKER

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-26 18:02:26 UTC
From: <parinc1@...>
Topic: 1874 Message: 1874

Although I sometimes use headphones, more often I am in the shop and listening to the X1M via its little speaker. Plugging an external speaker ito the headphone jack results in very very low audio.
There is a 100Ohm resistor in series with the headphone jack. It is easy to find and instead of shorting the resistor, you can easily short the two pins that connect it to the headphone jack. On the top PCB, right in front of the headphone jack you will see the SMD resistor (marked 101) and right behind the resistor two of the pins for the headphone socket. There area total of four pins- grouped in two sets of two. You want the right hand pair. Solder a small wire across those two pins and you can now use an external speaker or headphones.
Be sure to ALWAYS use a stereo plug in that jack or you may short the audio output to GND.
I am adding a highlighted file to my Photo Album= W4OP

I use a small Bose hifi speaker and the X1M audio is fabulous.
Enjoy,

Dale W4OP

The only thing i really wish this read had a tuner or at least an SWR meter, is there anyway to mod that in somehow?

Hi friends, who knows, how to connect computer with x1m by usb-com cabel directly or through special cabel db9? I tried the second one, but no tx. I wrote a number of com port in settings.

Are there any China distributors selling this or is this a "Ed" only product? I googled but I do not see much activity other than Ed's place. Is the radio going by another name?

ps: I am not in the US

There is a user guide in the Manuals section of the Files. There is a lot of good info there.

There is no room for anything like a bridge, tuner or the controls to operate them. I found the exact same cabinet as the X1M is available on eBay, so anyone could design their own power supplies, hi fi speakers, DSP, tuners etc.

My personal preference on tuners has always been to design antennas that do not require a tuner, its attendant losses, size, weight, cost and complexity.

Dale W4OP

well still even if you have an antenna that doesnt need a tuner you need to figure out what the SWR is to make sure your putting out all the power you can

SWR is a subject that can be discussed all day on here and not everyone will agree at the end of the day . Too many variables to consider . For the first at least 10 years of my nearly half century ham career I didn't even own an SWR bridge and neither did any operator in town that I knew !! Get a nice sharp dip on the plate and the rig loaded to the antenna and we managed to work the world without a SWR bridge . Ever turned your present one around in the line to see just how linear it is ??

Dale is a well know antenna designer and builder here in the USA . I have one of his unique designs here , an Omniangle on 17 meters . It replaced a G5RV dipole . Look at the gain figures on his antenna and you will certainly be confused if you read antenna manufacturers bloated figures often referenced to a wet noodle or something they never tell you about .

His antenna performs flawlessly ,I have added several new countries in the short time that I have had it and the really nice thing is it is an omni directional horizontal !! No need to worry about a rotor quitting or freezing up in the winter. One person can put it up and only takes minutes and a phillips screwdriver to assemble !!

Hi, X1M-Freaks,
today i've implemented an AGC with the schematic from Dale, W4OP.
I changed the following parts: C3 and C4 into 3,3µF and R4 into 470 kOhm.
With the original C3 and R4 the AGC was too slow for me.

I used a little prototype board and standard SMD-parts.
The AGC works good, I could test it in CQWWDX today

with the big guns from Europe, hi.
I've attached a photo.

73s from Germany

but thats exactly the problem this rig has no way of knowing what is going on. SWR wasnt critical on a tube rig but solid state design are picky because of their nature the reality is if you are reflecting 5 watts then you are going no where. The problem for this rig is finding out if you are reflect all your power back

Hans if you got on and ALL of the X1M guys would get on , we could cause quite a pile up on your frequency and make the big guns wonder :)

Thanks for sharing .

We could sure use more people sharing both good and bad experiences and experiments . The ONLY way this radio will be improved even more than it already has been , is by user participation and honest open feedback .

Best 73 , Charlie , W5COV

Not to get into a long theoretical discussion , but even if you see a 1:1 SWR at the radio is no assurance that you are radiating any power at the antenna , whether tube or transistor . If you are using a tuner then (I squared R) losses must be considered too , again tube or transistor .(Sorry no scientific notation fonts loaded)

Believe me I run a beacon on 1750 Meters (that's 186 kHz.) with one watt INPUT , into a less than 50 foot vertical antenna , so I have MICRO watts of ERP . I depend heavily on near field and far field readings to remain legal and to collect data , so I am fairly familiar with how important it is to transfer the power to the antenna . My finals are not very forgiving either since I run a complimentary pair of 10 cent plastic transistors like a 2N2222 .

I believe Dale's point was we should all strive to run resonant antennas , which I completely agree with . Yes my G5RV is a poor example , but it was a situation to be able to stay on the air . The 80 , 40 , 30 , half wave dipoles will soon return to the tower and I am getting or using resonant antennas on the other bands .

However, in the interest of not "frying" the finals -- JT65 and most digital modes are essentially "key down," cut back the drive to the transmitter some. This is the "TX" knob on the SignaLink USB, for instance.

1899. Upgrading X1M to X1M-Pro

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-27 21:42:03 UTC
From: <ed@...>
Topic: 1899 Message: 1899

The original X1M transceiver can be upgraded by replacing its display and front panel with that of the X1M-Pro. All features of the X1M-Pro will be available, most notable, the frequency bandwidth of the built-in filters.

These replacement displays and panels will be available in mid-November. Right now only 10 panels have been ordered but that number can be increased if pre-sales warrant it. You can place a pre-order now to reserve yours.

The ordering information page is
http://www.wouxun.us/item.php?item_id=308&category_id=65

Very nice Hans. One can play with the AGC R/C for life I think, not to mention the resting AGC voltage. I have certainly gone back and forth enough times to make me dizzy. Again, a very nice job. C4 just as an aside to others, and also C5 were added by W4SC who did the board layout- good engineering practice to make certain the Vcc buss does not have noise on it.

Hi, X1M-Freaks,
today i've implemented an AGC with the schematic from Dale, W4OP.
I changed the following parts: C3 and C4 into 3,3µF and R4 into 470 kOhm.
With the original C3 and R4 the AGC was too slow for me.

I used a little prototype board and standard SMD-parts.
The AGC works good, I could test it in CQWWDX today

with the big guns from Europe, hi.
I've attached a photo.

1901. 20 Watt Linear for X1M

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-27 21:51:31 UTC
From: <ed@...>
Topic: 1901 Message: 1901

A few months ago, I asked Xiegu to develop a 20 watt linear amplifier for the X1M. This project has been completed and I will receive a prototype soon. The amplifier will be the same size as the X1M and will be available as a no-soldering kit.

The estimated price is $249.95. Pre-orders are not being accepted at this time but an email list is being generated for anyone wishing to be updated of its availability.

You can add your name to the email notification list here:
http://www.wouxun.us/item.php?item_id=309&category_id=65

Regards,
Ed Griffin
Import Communications

ps
A 100 watt amplifier is also in the works

The other variable you may want to play with Hans is R3. Currently 1K, it controls the AGC attack time.

1905. X1M USB Digital interface

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-27 23:25:26 UTC
From: <lphebus@...>
Topic: 1905 Message: 1905

I just posted some pictures in a new album titled "X1M Digital Interface" describing a relatively simple to construct circuit that has worked well with WSPR (4-5 Watt) And PSK-31. Despite running the rig full out for ~2 minute WSPR transmissions, there was no sign of overheating. Sometimes for testing I ran back-to-back transmissions, 4 minutes full power 100% duty cycle...the rig didn't even seem to notice. Today I was transmitting 20% of the time (RX the other 80%) all afternoon and all went well, no issues. I posted a couple maps of contacts last night on 40m and today on 10 m, using the excellent PAR END FEDZ 40-20-10 antenna about 10-12 feet off the sandy AZ ground. I ran the transceiver through a wattmeter/SWR meter (Diamond SX-200) right into the antenna... no tuner. The SWR on 40 was 1.4 and on 10 was 1.1 (a little plug for a great antenna! More details if requested...

Lee , nice plug for well designed proper antennas :) Dale did a great job on that line and the company LNR , that he sold it to , seems to be continuing his tradition .
I am enjoying his omniangle antenna on 17 meters right now . Quite an antenna and a LOT of GREAT theory that he turned into some real world numbers that you can go to the bank with , not measured against a dummy load 6 foot in the ground :)
Hmmm now I have to look at your latest creation !! Any chance of 1750 this year ? My beacon will have its good old antenna on it and I hope that you can log it . Should be MUCH better than the past couple of years !! Arizona would be a new state for me on 1750 . Not many people listening out west , at least that post captures.

If you only run 1 watt into a 50 vertical on 1750, you can use a trick from the old timers. Use multi conductors fed like a 3 wire folded dipole. I built one with 13 conductors 7 feet long. Fed with 450 ohm window line to the tuner.When vertical it worked better then my full size G5RV, 30' at the center, for many of the stations we copied in the parking lot of the local Red Cross. For 1750 I would build it as a folded mono dipole. This antenna will not have a higher radiation resistance, but will have a lower DC resistance. Ever little bit helps.

Topic: 1905 Message: 1910

Sure Dale , I tried several while this one was off of the tower , even a horizontal wire , but this has been the top performer over the years .

I use a 42 foot long piece of wire that is some type of military surplus that I had laying around . I believe it may be nickel plated . It looks exactly like a brand new piece of regular stranded heavy TV guy wire . That is the main vertical radiator . It runs through the wall (through a small PVC tube) directly to the loading coil .

I use a 5 foot diameter or close to circular shape top hat , geometry is not too important . The "ring" for the capacity top hat is formed from a piece of about #8 solid copper wire . I also made an "X" or "+ " shaped piece to fit into the center of the circle and soldered to the edges of the circle then added a couple of more wires to fill in the gaps fairly closely . The vertical radiator wire runs right to the center of this , where it is soldered on .

I have a piece of large diameter schedule 80 PVC crossarm sticking must be about 8-9 foot out from the tower
in a horizontal plane . It is just about the 40 foot joint on the tower . I now once again thanks to a couple of young bow hunters ,have a nylon rope over this PVC arm that I tie to the top hat and use that to raise and lower the antenna . It is only a foot or so off of the ground where it turns to go to the shack wall . It is close enough I have had to shovel snow off of it .

My ground system will not work . (I wish I had known that before I had all of the 1500 mile captures <grin>) I use 3 , 8 foot long grounds bonded together as well as bonded to all the grounds . I will say it is likely my ground rods are in water , since I hit water at 5 foot that I had to seal off when I installed the tower . I have zero ground radials .

Harder to describe than what it really is . Just a few pieces of wire I happened to have on hand . It has been on the air for about a decade now , the last couple of years this antenna has been down , because my old nylon was string and broke . It has been copied regularly at high noon in Denver , Colorado .

Well a wiki is even easier you can sort by name and add pictures and
videos. plus it allows people who dont have access to yahoo groups to
receive information. Since there is little support i will create and manage
the wiki myself but i welcome anyone and everyone to contribute.

1912. Re: [X1M_QRP-Transceiver] Re: i saw something about AGC Boards is there anyway to build tuner boar

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-28 00:58:40 UTC
From: Charlie , W5COV
Topic: 1884 Message: 1912

I received a copy of an old NDB antenna booklet a couple of weeks back and it has some very similar designs in there Mark . I own the Yahoo part15 (no space between part and 15) group . I haven't been able for the past couple of years to do much vertical antenna testing , so some variations are on the schedule for this winter .

1914. Microphone Case Mod

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-28 05:30:55 UTC
From: Charlie , W5COV
Topic: 1914 Message: 1914

I think this may have been brought up before and just last night I got around to opening up my microphone
after Dale gave me a heads up on what he had found .

This is an easy and probably a good idea mod to improve your audio .

The microphone case is plastic so be careful when working with especially the PTT lever , because it pivots on two very small plastic pins molded on it .

When you take the back off of the microphone you will see the speaker in the center and the electret microphone element in the top corner in a round cavity that is pretty much totally enclosed and no holes to the outside world through the case .

Since the speaker isn't used and is pretty low quality , I removed my speaker completely .
Then to provide a little opening from the front grill to the electret I simply used an exacto knife and cut me about a 1/4 wide "duct" between where the speaker used to be and the housing surrounding the mic element . I trimmed the mic cavity so it was flush with the speaker mount lip .

Might help some of you a little with your audio .

Thanks to those that have brought this up . I didn't realize just how enclosed the mic really was .

Charlie , W5COV

Well i am still working on the content, i know at some point on the online website it was mentioned that you could get it as a kit. I am not sure about that anymore. Like i said it is a preliminary page which has already changed information. this is also why i need more people to help me edit to add or remove content that is true or not

On mine the little slits above the microphone element were open just a little and I opened them up more with a hobby knife. There is an opening between the speaker and the microphone element and I enlarged it too like you did.. On mine it looks like the front of the speaker is used to deflect the sound that enters the louvers on the front into the microphone element.

I forgot to say that we were on 40 meters around 1pm or so. It did not play
well on 80 meter. The feed line was 10 long or so. I'm not surprised that
it would not work on 80 with only 3 1/2 feet on a side of the dipole. When
it was vertical the top was only 10 feet high.

There is a picture of two different speech processors in the photo
version . Both I believe are from Lee's .
Lee/9 and Lee/7 . Lee in 7 land has his inside his microphone case.

I think Yahoo must still be working on this upgrade thing they started a few months ago . I sometimes have such a latency problem posts will often not show up for up to 24 hours . Probably much to the relief of many people :)
I just don't know a single thing about their Wiki project or how it works and I am getting old enough any change can be difficult . I grew up with Yahoo groups and have been very pleased with them until this upgrade . But I still like having a group with a focus on one particular radio and having all of our historical exchanges available for reference .

1929. AGC Board installed

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-28 19:35:17 UTC
From: <parinc1@...>
Topic: 1929 Message: 1929

I built up the first board and have it installed. Working beautifully; it took about 45 minutes- but a lot of that times was spent opening bags and sorting parts.
The pot is TINY and takes some care to get it soldered in properly. Everything else went as expected.

Now, for the first time since I got my radio, the cover is going on.

I'll start bagging parts this evening and am awaiting now bubble packs for shipping. We're getting close.
Two photos of the completed AGC are posted in my W4OP album.

Now, for the first time since I got my radio, the cover is going on. Although I have been thinking of a 4 pole crystal CW filter that would be enabled when CW mode is enabled......

Kitting those tiny parts would be the most difficult part of the entire project . Even these 1206 's look smaller almost by the day it seems like :)

Aw now Dale enjoy the case on for a while and enjoy the 3586 . lol

You know with me that there is never any hurry . Whenever you find time and get around to it works fine for me. I only keep track of days of the week for Dr. appointments and contests or special events stations . Well NASCAR schedules too :) My "boy" now 42 , sure got a nice win yesterday . Been with him since he was one of the Coke drivers !! I even remember that they had to rent a stick shift car to teach him to drive one when they first started looking at him . Man I am getting old !!

1935. RE: RE: Audio Compression 'Accessory Circuit' Idea to Increase SSB Output

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-28 20:54:58 UTC
From: <lphebus@...>
Topic: 1193 Message: 1935

I have posted an improved microphone with compression circuit in the photos section, "compression circuit" album. The advantage over the original design is that the compression chip is only active (~3mA current draw) when the mic is keyed. When the mic is not keyed, the chip goes into shutdown mode drawing <2 micro-Amps. My design is a battery-powered (2X AAA) replacement microphone, not a modification of the existing mic or X1M. The circuit mod should greatly extend battery life and allows elimination of the on/off switch.

---In X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> wrote:

I've bread boarded and tested an audio compressor circuit. Pictures are in the "Photos" section. Compression is adjustable from 1:1 to 6.25:1 which seems like plenty to me. It really helps the audio "punch" of the X1M. My plan is to put the circuit in the microphone case with a couple AAA batteries for power. I thought I would use a design like this http://www.qrpkits.com/microphone.html http://www.qrpkits.com/microphone.html . I tried to power it from the +5 volts the socket provides for the electret microphone, but the compressor current draw, although small (<3mA), loaded the 5V down to about 1.7 V. I am surprised by this. The AAA batteries should last a long time however. There are two potentiometers (blue) in the bread boarded circuit. The left is the compression level (Rcomp) and the right is the attenuator adjustment. The output of the compressor chip is a bit too high to feed directly into the X1M.

---In x1m_qrp-transceiver@yahoogroups.com, <cvest@...> wrote:

LOL Maybe that is why I am an old bachelor . My two dogs don't seem to complain at all and I am a true night person so I am not normally even on the net this early in the morning .

I work DX , various digital modes , the part 15 bands , and I am working on a new part 5 license , where the bands are night time bands , plus I have always enjoyed the peace and quiet of the wee morning hours .

If the bands aren't open I ALWAYS have at least one project on the bench that I am building and usually several at the same time .

However since I went to computer logging , I have gone back to using headsets , so my hands are pretty much free to type when I am on phone . One day I may need to add VOX to the X1M . Right now I have a momentary push button in a film can type plastic container to activate the PTT , until I decide what I want to put in a mic interface box for this little gem or see if I can possibly work with smaller SMT devices and squeeze something inside of it. I can go smaller but 1206 are the smallest I am really at ease with and they are fast disappearing from the market .

The more and more I look at this the more and more I want to play with little chip but it is in a tiny tiny MSOP package. And my soldering skills/hand steadiness is NO WHERE near close enough to jump right in. Anyone have a great easy way to put an MSOP chip onto a breadboard or anything like that? I've seen some 'easy' convertors for SMD chips but none for MSOP -- and I guess I haven't looked to see if they would work. Anyway -- if anyone has any great suggestions I'd appreciate it!

Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.htm

l http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

Lee , have you looked at I believe it is R48C in the radio , a 3.3K resistor and paralleling another 3.3K perhaps right on top of it to power your microphone ?

Dale and I were discussing it and he is much quicker with math and the diagrams and he came up with that idea to maybe do away with the batteries .

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

Hi Lee,
Measure exactly what your current drain is and change out the resistor that is in series with the 9T voltage that is impressed on the mic socket.
As Charlie pointed out, it is currently 3.3K at least on the schematic.

I bit the bullet and ordered a ssm2167 on a breakout board from them. I decided against soiling my playing with bad soldering fruseration for the moment and instead will forgo the extra coffee one day. I'm thinking and inline version would be the most useful to start out -- plug the mic into the inline box and then have a tail from the board into the rig. There isn't any room in the rig to stick it easily and putting it directly into the mic would limit it to one circuit per mic... also not flexible. The other option is a larger block in the middle of the mic cable but that seems the wrong way.

Anyone have any thoughts on a performed form factor for it?

The more and more I look at this the more and more I want to play with little chip but it is in a tiny tiny MSOP package. And my soldering skills/hand steadiness is NO WHERE near close enough to jump right in. Anyone have a great easy way to put an MSOP chip onto a breadboard or anything like that? I've seen some 'easy' convertors for SMD chips but none for MSOP -- and I guess I haven't looked to see if they would work. Anyway -- if anyone has any great suggestions I'd appreciate it!

-Chris

There is (was) a BuySafe guarantee, however it says it is good for 30 days only. Here is a cut and paste from the pdf document:
Corporate Guarantee Number: 07INT 010879-
00000013
ONLINE TRANSACTION CORPORATE GUARANTEE
WHEREAS, Kight Radio & Electronics as Principal ("Merchant") has entered into an online agreement
with gedanate@yahoo.com at gedanate@yahoo.com ("Buyer") for X1M QRP SSB/CW Transceiver [item or SKU], at URL
Kight Radio & Electronics ("Item"), as more particularly described in Merchant's web-site description and conditions of sale
(collectively, the "Sales Contract"), which Sales Contract is made a part hereof by reference; and WHEREAS, Buyer has
agreed to purchase from Merchant pursuant to the Sales Contract;
NOW, THEREFORE, it is agreed that Merchant and buySAFE Claim Services, Inc. are liable to Buyer up to the amount of
the Item price, being US $289.95, two hundred and eighty nine dollars and ninety five cents, for the payment of which sum,
and no more, we bind ourselves and our assigns subject to all terms, conditions and restrictions set forth below.
THIS CORPORATE GUARANTEE IS SUBJECT TO AND LIMITED BY THE FOLLOWING TERMS AND CONDITIONS:
1. This obligation is good for thirty (30) days from the close of the online transaction, which was 3/27/2013 (the "Closing
Date").
2. It is a condition precedent to the recovery on this Corporate Guarantee that notice of any potential claim on this
Corporate Guarantee must be registered with buySAFE, Inc. no later than thirty (30) days from the Closing Date
("Claim Deadline Date"). The Claim Deadline Date may not be extended for any reason, including, without
limitation, any term of the Sales Contract or other circumstance which may serve to extend the date of delivery of the
Item beyond thirty (30) days from the Closing Date.
3. It is a condition precedent to recovery on this Corporate Guarantee that the Merchant and the Buyer, to the extent
permitted by law, must have participated fully in the buySAFE, Inc. Dispute Resolution Process (as set forth elsewhere
on the buySAFE, Inc. site, www.buysafe.com). Where the buySAFE, Inc. Dispute Resolution Process is not
permitted by law, alternative procedures are available and are defined in the buySAFE, Inc. Terms and Conditions.
Notwithstanding any other provision herein, buySAFE Claim Services, Inc. shall be the sole arbiter of any claim
brought by Buyer in connection with this Corporate Guarantee.
4. The Corporate Guarantee ceases to be in force or effect in connection with any

transaction, in the event that:
a. Merchant satisfies the conditions of sale contained in the Sales Contract;
b. Merchant indemnifies and holds the Buyer harmless for an amount equal to or greater than the amount of this
Corporate Guarantee from all direct cost and damage incurred by reason of Merchant's failure to satisfy the
Sales Contract;
c. Buyer has not met the terms of the Sales Contract, including making full payment; or
d. The sale of the Item violates (i) any applicable law or regulation; (ii) the terms of use of the marketplace
governing the underlying online transaction; or (iii) buySAFE, Inc.'s Terms and Conditions, which is made a part
hereof by reference, and which may be viewed at www.buysafe.com.
5. Acceptance of the Item by Buyer terminates all liability of buySAFE Claim Services, Inc., unless a defect was not
known or discoverable at the time of acceptance, but in no circumstance will liability hereunder extend beyond thirty
(30) days after the Closing Date.
6. buySAFE Claim Services, Inc. reserves the right in its sole discretion to choose the method most appropriate to
remedy the Buyer's damages, if any.
7. buySAFE Claim Services, Inc. shall not be liable under any circumstances for any damages related to any of the
following:
a. Damages in excess of the Item price or TWENTY-FIVE THOUSAND DOLLARS ($25,000), whichever is less;
b. Express, implied or statutory product warranties or guarantees of any kind, including without limitation implied
warranties of merchantability or fitness for a particular purpose;
c. Special, incidental, consequential or punitive damages; or
d. Diminution in value of the Item.
8. Any litigation by the parties to and based on this Corporate Guarantee must be commenced within one year from the
Closing Date, except where the applicable period of limitation required by law is longer, then such period shall be the
shortest allowable by such law.
Signed, sealed, and dated this 27th day of March, 2013 at 2:19 AM PT at OK .
DAY MONTH YEAR TIME STATE
Principal: Kight Radio & Electronics
MERCHANT NAME
Guarantor: buySAFE Claim Services, Inc.

Well still sweet bugger-all from Dale Kight of Kight Radio & Electronics. No refund, no radio and no answers.

I went back through my emails and discovered I actually paid the guy on March 27th, 2013. It is order number KR-1162.

Still no answers to my emails or to messages posted directly to his web page. Sadly I can find no Paypal record, so I must have used by credit card with him directly instead.

I don't care what his problems are, when he ignores his customers and will not communicate, then there is no excuse.

Thanks Dale, I see that resistor R48C is limiting the current to the mic. I've got the battery-powered one nearly completed. Once done, I'll take a look at lowering that resistor value and building one powered by the X1M. It should easily fit into the X1M stock mic case. My experience so far suggests that a little compression really adds to the average signal power and readability.

If the bands aren't open I ALWAYS have at least one project on the bench that I am building and usually several at the same time .

However since I went to computer logging , I have gone back to using headsets , so my hands are pretty much free to type when I am on phone . One day I may need to add VOX to the X1M . Right now I have a momentary push button in a film can type plastic container to activate the PTT , until I decide what I want to put in a mic interface box for this little gem or see if I can possibly work with smaller SMT devices and squeeze something inside of it. I can go smaller but 1206 are the smallest I am really at ease with and they are fast disappearing from the market .

I bit the bullet and ordered a ssm2167 on a breakout board from them. I decided against soiling my playing with bad soldering fruseration for the moment and instead will forgo the extra coffee one day. I'm thinking and inline version would be the most useful to start out -- plug the mic into the inline box and then have a tail from the board into the rig. There isn't any room in the rig to stick it easily and putting it directly into the mic would

limit it to one circuit per mic... also not flexible. The other option is a larger block in the middle of the mic cable but that seems the wrong way.

Anyone have any thoughts on a performed form factor for it?

The more and more I look at this the more and more I want to play with little chip but it is in a tiny tiny MSOP package. And my soldering skills/hand steadiness is NO WHERE near close enough to jump right in. Anyone have a great easy way to put an MSOP chip onto a breadboard or anything like that? I've seen some 'easy' convertors for SMD chips but none for MSOP -- and I guess I haven't looked to see if they would work. Anyway -- if anyone has any great suggestions I'd appreciate it!

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:
Thank Ken! Yup I'm thinking with 5 w I'm going to want the most talk power for the punch of

my voice. Although I haven't done the math to see the difference between 0.5w and 5w. if my db brain remembers it probably isn't that much ! much like the difference between 5w and 100w ;) But I suspect it is bigger if I compare 0.5 w to 100w ;) And the goal is to get it as compressed and gained right to point before degrading! And we will see where that lands me! And to top that off the neighbor in the new apartment is really sensitive to me talking at night -- she has come twice at 1am to ask me to keep it down while conversing with a friend at lower than normal voices already. So the more punch I can get out of the mic at lower levels the more I can work in the nighhhhhhht!

And thanks for the thumbs up I'm loving the trip!
-Chris

Great attitude, Chris! I'm not familiar with that IC, but it sounds as though it has the functions you are seeking. Reasonable compression will add substantially to your "talk power." Like most things, it can be overdone and degrade your signal. Sounds as though you are tackling the learning opportunities this little rig offers with zest and enthusiasm. Have fun and enjoy the trip!
Ken, W1KRT

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:
Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

Well still sweet bugger-all from Dale Kight of Kight Radio & Electronics. No refund, no radio and no answers.

I went back through my emails and discovered I actually paid the guy on March 27th, 2013. It is order number KR-1162.

Still no answers to my emails or to messages posted directly to his web page. Sadly I can find no Paypal record, so I must have used by credit card with him directly instead.

I don't care what his problems are, when he ignores his customers and will not communicate, then there is no excuse.

---In X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> wrote:

I have seen other X1M buyers complain in this Group about KightRadio ignoring them, and I have stuck up for KightRadio in the past, defended them from all kinds of angry comments.

I sent in my money as a pre-paid order back in May, and I have gotten to the point where I am not willing to wait any more.

Dale used to answer my emails, months ago, but the last answer I received from him (whan i said gimme me radio or refund my money!) just said "Are you receiving my emails?" and it said absolutely nothing else. It didn't say what was happening.

Since that time I have emailed a further 5 or so enquiries, and all of them have been ignored. So I now feel rather negatively towards KightRadio, since they have not handled the situation at all well, as far as I can see.

Is the Dale I have recently seen discussing this little transceiver the same Dale who once replied to me politely from KightRadio, or are they two different people?

I do know the factory has been very very slow in sending KightRadio the units they had ordered, but from what I have been reading in here for all these months, the radio still has so many things wrong with it I am not comfortable with the idea of trying to fix the thing when (or if) I ever get one.

So I want my money back, unless I know I will get one with all the fixes - such as the CW alignment - done properly by the factory.. Then again, I might well die of old age waiting.

What do you suggest, guys? And Dale, are you the guy I should be talking to or is that Dale somebody else? I have already paid KightRadio for the rig, so if they can't supply it, they ought to refund me. I am certainly not willing to pay twice for the radio.

Hello David and Group,

I'm still here waiting myself too. That is, for my RMA'd replacement. Last reply was August 20, saying radios would be in within a week or less at the time. The latest word from those in the group seem to suggest the next batch of radios should be "arriving" sometime in mid November. At this point, I'm going to wait until these radios supposedly should come in. If I do not see or hear anything by the end of next month, then I'm getting proactive. I agree . . . he should be communicating to us. I know he is capable of it . . . that's one of the reasons why i bought from him in the first place. Still though, you would think he would at least pipe up with his reputation on the line. Ultimately, I would still like a radio. I paid for it, and I got a defective product. He offered a warranty replacement, and I went that route. A warranty is a warranty, after all. Sadly though, this whole experience has left me quite frustrated. Sorry if I'm not making sense here.

BTW, could Ed from Import Communications get us some answers from Dale K?

That's great Lee! And good eyes Charlie and Dale re: powering from the radio. I'm working on mine with a battery tonight so I'll peak at yours after I give mine it's first run. HA! Glad to hear the punch seems to be really helping the x1m. :)

-Chris

---In x1m_qrp-transceiver@yahoogroups.com, <lphebus@...> wrote:

Thanks Dale, I see that resistor R48C is limiting the current to the mic. I've got the battery-powered one nearly completed. Once done, I'll take a look at lowering that resistor value and building one powered by the X1M. It should easily fit into the X1M stock mic case. My experience so far suggests that a little compression really adds to the average signal power and readability.

Lee

☐ Hi Lee,
Measure exactly what your current drain is and change out the resistor that is in series with the 9T voltage that is impressed on the mic socket.
As Charlie pointed out, it is currently 3.3K at least on the schematic.

Lee , have you looked at I believe it is R48C in the radio , a 3.3K resistor and paralleling another 3.3K perhaps right on top of it to power your microphone ?

Dale and I were discussing it and he is much quicker with math and the diagrams and he came up with that idea to maybe do away with the batteries .

Charlie , W5COV

On 10/28/2013 3:54 PM, lphebus@... mailto:lphebus@... wrote:

I have posted an improved microphone with compression circuit in the photos section, "compression circuit" album. The advantage over the original design is that the compression chip is only active (~3mA current draw) when the mic is keyed. When the mic is not keyed,

the chip goes into shutdown mode drawing <2 micro-Amps. My design is a battery-powered (2X AAA) replacement microphone, not a modification of the existing mic or X1M. The circuit mod should greatly extend battery life and allows elimination of the on/off switch.

---In X1M_QRP-Transceiver@yahoogroups.com mailto:X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> mailto:x1m_qrp-transceiver@yahoogroups.com wrote:

I've bread boarded and tested an audio compressor circuit. Pictures are in the "Photos" section. Compression is adjustable from 1:1 to 6.25:1 which seems like plenty to me. It really helps the audio "punch" of the X1M. My plan is to put the circuit in the microphone case with a couple AAA batteries for power. I thought I would use a design like this http://www.qrpkits.com/microphone.html http://www.qrpkits.com/microphone.html . I tried to power it from the +5 volts the socket provides for the electret microphone, but the compressor current draw, although small (<3mA), loaded the 5V down to about 1.7 V. I am surprised by this. The AAA batteries should last a long time however. There are two potentiometers (blue) in the bread boarded circuit. The left is the compression level (Rcomp) and the right is the attenuator adjustment. The output of the compressor chip is a bit too high to feed directly into the X1M.

Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

Glad your's is working Lee! My first run ended with a big nothing. Not a surprise but it is always nice to be hopeful. I just got no output out of my circuit at all that I could see. So I'm gonna hit the sack and take a look at it later with some fresh eyes. For all I know I put the IC in backwards in regard to pin 1. Even thought I checked like 10 times ;) If I am lucky the IC survived whatever I did to it!

Glad to hear of your success and thanks for sharing it!

I am not looking at the schematic right now, but likely you will have to take into account the LED current in the mic also- or simply do away with that LED.

Charlie , W5COV

On 10/28/2013 3:54 PM, lphebus@... wrote:

I have posted an improved microphone with compression circuit in the photos section, "compression circuit" album. The advantage over the original design is that the compression chip is only active (~3mA current draw) when the mic is keyed. When the mic is not keyed, the chip goes into shutdown mode drawing <2 micro-Amps. My design is a battery-powered (2X AAA) replacement microphone, not a modification of the existing mic or X1M. The circuit mod should greatly extend battery life and allows elimination of the on/off switch.

---In X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> wrote:

I've bread boarded and tested an audio compressor circuit. Pictures are in the "Photos" section. Compression is adjustable from 1:1 to 6.25:1 which seems like plenty to me. It really helps the audio "punch" of the X1M. My plan is to put the circuit in the microphone case with a couple AAA batteries for power. I thought I would use a design like this http://www.qrpkits.com/microphone.html . I tried to power it from the +5 volts the socket provides for the electret microphone, but the compressor current draw, although small (<3mA), loaded the 5V down to about 1.7 V. I am surprised by this. The AAA batteries should last a long time however. There are two potentiometers (blue) in the bread boarded circuit. The left is the compression level (Rcomp) and the right is the attenuator adjustment. The output of the compressor chip is a bit too high to feed directly into the X1M.

LOL Maybe that is why I am an old bachelor . My two dogs don't seem to complain at all and I am a true night person so I am not normally even on the net this early in the morning .

I work DX , various digital modes , the part 15 bands , and I am working on a new part 5 license , where the bands are night time bands , plus I have always enjoyed the peace and quiet of the wee morning hours .

If the bands aren't open I ALWAYS have at least one project on the bench that I am building and usually several at the same time .

However since I went to computer logging , I have gone back to using headsets , so my hands are pretty much free to type when I am on phone . One day I may need to add VOX to the X1M . Right now I have a momentary push button in a film can type plastic container to activate the PTT , until I decide what I want to put in a mic interface box for this little gem or see if I can possibly work with smaller SMT devices and squeeze something inside of it. I can go smaller but 1206 are the smallest I am really at ease with and they are fast disappearing from the market .

1956. X1M Tilt Foot and Other Mechanical Changes

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-29 12:56:24 UTC
From: Dale Parfitt
Topic: 1956 Message: 1956

That is a tilt foot. Pretty much identical to what the SGC SG-2020 used. It folds up and then the radio sits flat. But with the tilt foot engaged the radio is tilted at a perfect height and air gets under the rig to help cool it.

I also exchanged the socket head cap screws for black button head screws on the front panel- much nicer look and less obtrusive. Finally, I used my mill to double the number of holes for the speaker- but that is not readily visible in the photo.

I should have done that, as I was constantly engaging and disengaging the AGC. When listening to a roundtable or causal tuning, it is very impressive.
But now, the radio is back in its cabinet- so no can do. We'll have to wait for someone else to do the A/B.

I have posted an improved microphone with compression circuit in the photos section, "compression circuit" album. The advantage over the original design is that the compression chip is only active (~3mA current draw) when the mic is keyed. When the mic is not keyed, the chip goes into shutdown mode drawing <2 micro-Amps. My design is a battery-powered (2X AAA) replacement microphone, not a modification of the existing mic or X1M. The circuit mod should greatly extend battery life and allows elimination of the on/off switch.

---In X1M_QRP-Transceiver@yahoogroups.com, <mailto:x1m_qrp-transceiver@yahoogroups.com> <x1m_qrp-transceiver@yahoogroups.com> wrote:

I've bread boarded and tested an audio compressor circuit. Pictures are in the "Photos" section. Compression is adjustable from 1:1 to 6.25:1 which seems like plenty to me. It really helps the audio "punch" of the X1M. My plan is to put the circuit in the microphone case with a couple AAA batteries for power. I thought I would use a design like this <http://www.qrpkits.com/microphone.html> http://www.qrpkits.com/microphone.html . I tried to power it from the +5 volts the socket provides for the electret microphone, but the compressor current draw, although small (<3mA), loaded the 5V down to about 1.7 V. I am surprised by this. The AAA batteries should last a long time however. There are two potentiometers (blue) in the bread boarded circuit. The left is the compression level (Rcomp) and the right is the attenuator adjustment. The output of the compressor chip is a bit too high to feed directly into the X1M.

LOL Maybe that is why I am an old bachelor . My two dogs don't seem to complain at all and I am a true night person so I am not normally even on the net this early in the morning .

I work DX , various digital modes , the part 15 bands , and I am working on a new part 5 license , where the bands are night time bands , plus I have always enjoyed the peace and quiet of the wee morning hours .

If the bands aren't open I ALWAYS have at least one project on the bench that I am building and usually several at the same time .

However since I went to computer logging , I have gone back to using headsets , so my hands are pretty much free to type when I am on phone . One day I may need to add VOX to the X1M . Right now I have a momentary push button in a film can type plastic container to activate the PTT , until I decide what I want to put in a mic interface box for this little gem or see if I can possibly work with smaller SMT devices and squeeze something inside of it. I can go smaller but 1206 are the smallest I am really at ease with and they are fast

disappearing from the market .

I bit the bullet and ordered a ssm2167 on a breakout board from them. I decided against soiling my playing with bad soldering fruseration for the moment and instead will forgo the extra coffee one day. I'm thinking and inline version would be the most useful to start out -- plug the mic into the inline box and then have a tail from the board into the rig. There isn't any room in the rig to stick it easily and putting it directly into the mic would limit it to one circuit per mic... also not flexible. The other option is a larger block in the middle of the mic cable but that seems the wrong way.

Anyone have any thoughts on a performed form factor for it?

The more and more I look at this the more and more I want to play with little chip but it is in a tiny tiny MSOP package. And my soldering skills/hand steadiness is NO WHERE near close enough to jump right in. Anyone have a great easy way to put an MSOP chip onto a breadboard or anything like that? I've seen some 'easy' convertors for SMD chips but none for MSOP -- and I guess I haven't looked to see if they would work. Anyway -- if anyone has any great suggestions I'd appreciate it!

-Chris

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:

Thank Ken! Yup I'm thinking with 5 w I'm going to want the most talk power for the punch of my voice. Although I haven't done the math to see the difference between 0.5w and 5w. if my db brain remembers it probably isn't that much ! much like the difference between 5w and 100w ;) But I suspect it is bigger if I compare 0.5 w to 100w ;) And the goal is to get it as compressed and gained right to point before degrading! And we will see where that lands me! And to top that off the neighbor in the new apartment is really sensitive to me talking at night -- she has come twice at 1am to ask me to keep it down while conversing with a friend at lower than normal voices already. So the more punch I can get out of the mic at lower levels the more I can work in the nighhhhhhht!

And thanks for the thumbs up I'm loving the trip!

-Chris

--- In x1m_qrp-transceiver@yahoogroups.com, <krtdowns@...> wrote:

Great attitude, Chris! I'm not familiar with that IC, but it sounds as though it has the functions you are seeking. Reasonable compression will add substantially to your "talk power." Like most things, it can be overdone and degrade your signal. Sounds as though you are tackling the learning opportunities this little rig offers with zest and enthusiasm. Have fun and enjoy the trip!

Ken, W1KRT

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:

Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip:

http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

☐

That is a tilt foot. Pretty much identical to what the SGC SG-2020 used. It folds up and then the radio sits flat. But with the tilt foot engaged the radio is tilted at a perfect height and air gets under the rig to help cool it.

I also exchanged the socket head cap screws for black button head screws on the front panel- much nicer look and less obtrusive. Finally, I used my mill to double the number of holes for the speaker- but that is not readily visible in the photo.

Hi Lee,
eBay item # 120957745111

The kit consists of three feet- 2 for the rear so that when the tilt foot is folded up, the radio sits flat.
I have put them on a number of my radios. See my ARK-40 that I converted from thumbwheel to optical encoder:
http://www.parelectronics.com/vintage-ss-engineering-ark-40.php
Previously, I have always attached them with screws, but on the X1M I used JB Weld and they appear to be there forever.

Thank you, Charlie W5COV.

You leapt to this Dale's defense once before and I thanked you back then for your clarification. There is no need to "yell" at me using capital letters a second time. I already apologised to your Dale, (the guy who designed the original Endfedz half-wave antennas, who is also prominent in this Group).

Meanwhile, I have received a reply overnight from BuySafe, the company that was paid to guarantee my purchase. I left a message and this is the answer I got today:

"David,

Thank you for contacting buySAFE.

The bond you have for this purchase expired 30 days after the purchase date. You'll need to resolve this directly with the merchant since the bond expired quite awhile ago.

Regards,
Fred
buySAFE, Inc."

I guess it goes to show one should never pay in advance for anything, and certainly not to Kight Electronics. Dale Kight does not respond to emails or customer complaints. They got my money six months ago, and I am still without a refund or the radio I paid for.

Yes. I am pissed off.

David Harvey, VK2DMH.

There is (was) a BuySafe guarantee, however it says it is good for 30 days only. Here is a cut and paste from the pdf document:
Corporate Guarantee Number: 07INT 010879-
00000013

ONLINE TRANSACTION CORPORATE GUARANTEE
WHEREAS, Kight Radio & Electronics as Principal ("Merchant") has entered into an online agreement
with gedanate@... mailto:gedanate@... at gedanate@... mailto:gedanate@... ("Buyer") for X1M QRP SSB/CW Transceiver [item or SKU], at URL
Kight Radio & Electronics ("Item"), as more particularly described in Merchant's web-site description and conditions of sale
(collectively, the "Sales Contract"), which Sales Contract is made a part hereof by reference; and WHEREAS, Buyer has
agreed to purchase from Merchant pursuant to the Sales Contract;
NOW, THEREFORE, it is agreed that Merchant and buySAFE Claim Services, Inc. are liable to Buyer up to the amount of
the Item price, being US $289.95, two hundred and eighty nine dollars and ninety five cents, for the payment of which sum,
and no more, we bind ourselves and our assigns subject to all terms, conditions and restrictions set forth below.
THIS CORPORATE GUARANTEE IS SUBJECT TO AND LIMITED BY THE FOLLOWING TERMS AND CONDITIONS:
1. This obligation is good for thirty (30) days from the close of the online transaction, which was 3/27/2013 (the "Closing
Date").
2. It is a condition precedent to the recovery on this Corporate Guarantee that notice of any potential claim on this
Corporate Guarantee must be registered with buySAFE, Inc. no later than thirty (30) days from the Closing Date
("Claim Deadline Date"). The Claim Deadline Date may not be extended for any reason, including, without
limitation, any term of the Sales Contract or other circumstance which may serve to extend the date of delivery of the
Item beyond thirty (30) days from the Closing Date.
3. It is a condition precedent to recovery on this Corporate Guarantee that the Merchant and the Buyer, to the extent
permitted by law, must have participated fully in the buySAFE, Inc. Dispute Resolution Process (as set forth elsewhere
on the buySAFE, Inc. site, www.buysafe.com http://www.buysafe.com). Where the buySAFE, Inc. Dispute Resolution Process is not
permitted by law, alternative procedures are available and are defined in the buySAFE, Inc. Terms and Conditions.
Notwithstanding any other provision herein, buySAFE Claim Services, Inc. shall be the sole arbiter of any claim
brought by Buyer in connection with this Corporate Guarantee.
4. The Corporate Guarantee ceases to be in force or effect in connection with any transaction, in the event that:
a. Merchant satisfies the conditions of sale contained in the Sales Contract;
b. Merchant indemnifies and holds the Buyer harmless for an amount equal to or greater than the amount of this
Corporate Guarantee from all direct cost and damage incurred by reason of Merchant's failure to satisfy the
Sales Contract;
c. Buyer has not met the terms of the Sales Contract, including making full payment; or
d. The sale of the Item violates (i) any applicable law or regulation; (ii) the terms of

use of the marketplace
governing the underlying online transaction; or (iii) buySAFE, Inc.'s Terms and Conditions, which is made a part
hereof by reference, and which may be viewed at www.buysafe.com http://www.buysafe.com.
5. Acceptance of the Item by Buyer terminates all liability of buySAFE Claim Services, Inc., unless a defect was not
known or discoverable at the time of acceptance, but in no circumstance will liability hereunder extend beyond thirty
(30) days after the Closing Date.
6. buySAFE Claim Services, Inc. reserves the right in its sole discretion to choose the method most appropriate to
remedy the Buyer's damages, if any.
7. buySAFE Claim Services, Inc. shall not be liable under any circumstances for any damages related to any of the
following:
a. Damages in excess of the Item price or TWENTY-FIVE THOUSAND DOLLARS ($25,000), whichever is less;
b. Express, implied or statutory product warranties or guarantees of any kind, including without limitation implied
warranties of merchantability or fitness for a particular purpose;
c. Special, incidental, consequential or punitive damages; or
d. Diminution in value of the Item.
8. Any litigation by the parties to and based on this Corporate Guarantee must be commenced within one year from the
Closing Date, except where the applicable period of limitation required by law is longer, then such period shall be the
shortest allowable by such law.
Signed, sealed, and dated this 27th day of March, 2013 at 2:19 AM PT at OK .

---In X1M_QRP-Transceiver@yahoogroups.com mailto:X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> mailto:x1m_qrp-transceiver@yahoogroups.com wrote:

I have seen other X1M buyers complain in this Group about KightRadio ignoring them, and I have stuck up for KightRadio in the past, defended them from all kinds of angry comments.

I sent in my money as a pre-paid order back in May, and I have gotten to the point where I am not willing to wait any more.

Dale used to answer my emails, months ago, but the last answer I received from him (whan i said gimme me radio or refund my money!) just said "Are you receiving my emails?" and it said absolutely nothing else. It didn't say what was happening.

Since that time I have emailed a further 5 or so enquiries, and all of them have been ignored. So I now feel rather negatively towards KightRadio, since they have not handled the situation at all well, as far as I can see.

Is the Dale I have recently seen discussing this little transceiver the same Dale who once replied to me politely from KightRadio, or are they two different people?

I do know the factory has been very very slow in sending KightRadio the units they had ordered, but from what I have been reading in here for all these months, the radio still has so many things wrong with it I am not comfortable with the idea of trying to fix the thing when (or if) I ever get one.

So I want my money back, unless I know I will get one with all the fixes - such as the CW alignment - done properly by the factory.. Then again, I might well die of old age waiting.

What do you suggest, guys? And Dale, are you the guy I should be talking to or is that Dale somebody else? I have already paid KightRadio for the rig, so if they can't supply it, they ought to refund me. I am certainly not willing to pay twice for the radio.

73 de David Harvey, vk2dmh.

Hi David ,

I apologize if you consider it yelling . I have been on the net for around 30 years and don't consider capitals yelling . Merely a difference of our conception . I use them just to emphasize a point .

The only reason is that your post still contained the questioning of Dale , W4OP , who is a good friend of mine. There are many new group members that saw that and I once again did not want anyone to doubt a professional who I know to be extremely honest and trustworthy and did not want it to anyway reflect on his own company that is also in the electronics business .

I just wanted to assure all of the new group members that they were indeed two very different people .

Many members have probably never gone through the archives and seen the original posts .

I again apologize if it offended you .

I too do the same thing and ONLY use capitals when I make an emphasis, otherwise not..and I likely will always continue to do that… Just my 2 cents worth on this matter as well…

Fred

VE3FAL

[Fred VE3FAL] I don't consider capitals yelling . Merely a difference of our conception . I use them just to emphasize a point .

There is no need to "yell" at me using capital letters

1982. RE: Audio Compression 'Accessory Circuit' Idea to Increase SSB Output

From: <orders@...>
Topic: 1193 Message: 1982

I think I might need another chip. Oops.

I figured 2 important mis wires in my circuit compared to yours Lee. I wired the 2 control pins via resistors/jumpers to + instead of to GND. Once I wired those up right I at least saw traces on the computer based audio scope. One recording was complete static with no voice audio.

I'm also using a 100k resistor for the shutdown resistor instead of 470k b/c i I had it.

So that is where I am at tonight. I'm gonna put all the bits down for now and maybe get some more chips on order b/c I can't image it was happy with 3V into those two pins.

That's great Lee! And good eyes Charlie and Dale re: powering from the radio. I'm working on mine with a battery tonight so I'll peak at yours after I give mine it's first run. HA! Glad to hear the punch seems to be really helping the x1m. :)

Thanks Dale, I see that resistor R48C is limiting the current to the mic. I've got the battery-powered one nearly completed. Once done, I'll take a look at lowering that resistor value and building one powered by the X1M. It should easily fit into the X1M stock mic case. My experience so far suggests that a little compression really adds to the average signal power and readability.

Hi Lee,

Measure exactly what your current drain is and change out the resistor that is in series with the 9T voltage that is impressed on the mic socket.

As Charlie pointed out, it is currently 3.3K at least on the schematic.

Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully

functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

Hi Dale,

I hope you are well. The completed board and the specs look great! I cant wait to add one of these to my rig. Well done!

Are they available for sale as a complete kit as yet? Sorry if I missed the details on this... (And apologies if I am jumping the gun - I know how busy you are at the moment!)

Cheers,

Perrin VK3XPT

Date: 2013-10-30 14:52:58 UTC
From: Heath - VK3TWO / VK6TWO
Topic: 1359 Message: 1990

David,

If you want to get one locally in VK, head here <http://www.spooktech.net>.

A fellow ham here in VK6 also ordered one from Kight. Difference with his case is that one actually arrived (the original version) after weeks/months of incommunicado, but it was faulty. It was returned back to Kight, and a full refund was given. Several weeks later, a small HF amplifier arrived in the mail from Kight, which he didn't order, but turns out he was charged for. Understandably he didn't want the amplifier, nor the cost of returning it, and certainly didn't want to pay for something he hadn't authorised payment for.

I'm not sure what the outcome was, but it sounded ugly at the time. If you want to know the outcome, I can find out for you if you want to reply to me 'off list'.

1991. Z axis conductive tape for surface mounts?

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-30 15:12:29 UTC
From: <lphebus@...>
Topic: 1991 Message: 1991

I just saw in the new products video from SparkFun electronics that they sell a double-sided tape that only conducts through the thin axis of the tape, the "Z axis". In their video (accessible from this page https://www.sparkfun.com/products/12042 https://www.sparkfun.com/products/12042), they use the tape to connect a surface-mount processor chip to a circuit board. If you scroll down the page, you will see comments from customers. They help put things in perspective and define the limitations.

I know that, for various reasons, some are hesitant to use surface mount parts. This tape could be useful to breadboard chips (on breakout boards) that one might not otherwise consider using because of the surface mount hassle. You could then know if the circuit works and embark on the surface mount soldering task with confidence it is worth the effort. Alternatively, maybe the tape is rugged enough to use in a "production" mode? Just FYI...

BTW, the minimum pitch the tape is specified for is 0.4 mm (although in the comments on the Sparkfun page some point out that the datasheet suggests it will probably work for smaller). The compression chip being used by some in this group has a 0.5 mm pitch, so it should work well.

1992. Ordering X1M AGC

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-10-30 16:46:56 UTC
From: Dale Parfitt
Topic: 1992 Message: 1992

I will begin shipping kits on Friday- awaiting padded envelopes that were supposed to be here Monday.

Anyway, here is what I have worked out:
Domestic orders are $11. Foreign orders $13. I really don't want to make money on this, but sure don't want to lose either- I hope everyone will be happy with the priceing

I have all the tiny boards sheared up. Parts will come all packaged together. SMD resistor values are marked. There are only 2 different capacitor values and their physical size distinguishes one from another. The single diode is also unique in its footprint. The larger sized pots are due in today.

I will continue to update the on-line manual but for now- you will need an excellent pair of flush cutters in order to lift pin 5 of the MC1350 RF amp. You must also have already done my AF Gain mod as the additonal 12dB of gain is essential for the AGC. Finally, you will need a small piece of doube sided foam tape- about 1/32" (1mm) thick. I will supply ribbon cable for the 4 hook up leads.

Send payment via PayPal to parinc1@...
BE SURE YOUR POSTAL ADDRESS IS SELECTED IN THE PAYPAL FORM. Also reference X1M AGC in the Subject field.

The larger pots just arrived.
I will confirm each order as it arrives.

73 & GL,

Dale W4OP

Hello Dale,

Your e-mail address is truncated through Yahoo after the @ sign. What is the latter part of your e-mail (is it @...)? Ultimately, I'm interested in a kit.

Thanks,
John Golub
KC8JZO

---In X1M_QRP-Transceiver@yahoogroups.com mailto:X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com mailto:x1m_qrp-transceiver@yahoogroups.com> wrote:

I will begin shipping kits on Friday- awaiting padded envelopes that were supposed to be here Monday.

Anyway, here is what I have worked out:
Domestic orders are $11. Foreign orders $13. I really don't want to make money on this, but sure don't want to lose either- I hope everyone will be happy with the priceing

I have all the tiny boards sheared up. Parts will come all packaged together. SMD resistor values are marked. There are only 2 different capacitor values and their physical size distinguishes one from another. The single diode is also unique in its footprint. The larger sized pots are due in today.

I will continue to update the on-line manual but for now- you will need an excellent pair of flush cutters in order to lift pin 5 of the MC1350 RF amp. You must also have already done my AF Gain mod as the additonal 12dB of gain is essential for the AGC. Finally, you will need a small piece of doube sided foam tape- about 1/32" (1mm) thick. I will supply ribbon cable for the 4 hook up leads.

Send payment via PayPal to parinc1@... mailto:parinc1@...
BE SURE YOUR POSTAL ADDRESS IS SELECTED IN THE PAYPAL FORM. Also reference X1M AGC in the Subject field.

The larger pots just arrived.
I will confirm each order as it arrives.

73 & GL,

Dale W4OP

I think you are going to have to spell the e-mail address out without the @ sign. Yahoo keeps truncating the last part of the address, replacing it with an ellipsis.

It is the resistor mod from pin 1 of the LM-386 for additional audio
gain that is being mentioned .

From: Dale Parfitt
Topic: 1992 Message: 2008

Are you referring to the audio gain mod? It just involves shorting out R80C and has been discussed extensivly here.

I think you are going to have to spell the e-mail address out without the @ sign. Yahoo keeps truncating the last part of the address, replacing it with an ellipsis.

Hello Dale,

Your e-mail address is truncated through Yahoo after the @ sign. What is the latter part of your e-mail (is it @...)? Ultimately, I'm interested in a kit.

Thanks,

John Golub

KC8JZO

---In X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> wrote:

Anyway, here is what I have worked out:
Domestic orders are $11. Foreign orders $13. I really don't want to make money on this, but sure don't want to lose either- I hope everyone will be happy with the priceing

I have all the tiny boards sheared up. Parts will come all packaged together. SMD resistor values are marked. There are only 2 different capacitor values and their physical size distinguishes one from another. The single diode is also unique in its footprint. The larger sized pots are due in today.

I will continue to update the on-line manual but for now- you will need an excellent pair of flush cutters in order to lift pin 5 of the MC1350 RF amp. You must also have already done my AF Gain mod as the additonal 12dB of gain is essential for the AGC. Finally, you will need a small piece of doube sided foam tape- about 1/32" (1mm) thick. I will supply ribbon cable for the 4 hook up leads.

Send payment via PayPal to parinc1@...
BE SURE YOUR POSTAL ADDRESS IS SELECTED IN THE PAYPAL FORM. Also reference X1M AGC in the Subject field.

The larger pots just arrived.
I will confirm each order as it arrives.

73 & GL,

Dale W4OP

Hello Dale,

Your e-mail address is truncated through Yahoo after the @ sign. What is the latter part of your e-mail (is it @...)? Ultimately, I'm interested in a kit.

Thanks,
John Golub
KC8JZO

---In X1M_QRP-Transceiver@yahoogroups.com mailto:X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com mailto:x1m_qrp-transceiver@yahoogroups.com> wrote:

I will begin shipping kits on Friday- awaiting padded envelopes that were supposed to be here Monday.

Anyway, here is what I have worked out:
Domestic orders are $11. Foreign orders $13. I really don't want to make money on this, but sure don't want to lose either- I hope everyone will be happy with the priceing

I have all the tiny boards sheared up. Parts will come all packaged together. SMD resistor values are marked. There are only 2 different capacitor values and their physical size distinguishes one from another. The single diode is also unique in its footprint. The larger sized pots are due in today.

I will continue to update the on-line manual but for now- you will need an excellent pair of flush cutters in order to lift pin 5 of the MC1350 RF amp. You must also have already done my AF Gain mod as the additonal 12dB of gain is essential for the AGC. Finally, you will need a small piece of doube sided foam tape- about 1/32" (1mm) thick. I will supply ribbon cable for the 4 hook up leads.

Send payment via PayPal to parinc1@... mailto:parinc1@...
BE SURE YOUR POSTAL ADDRESS IS SELECTED IN THE PAYPAL FORM. Also reference X1M AGC in the Subject field.

The larger pots just arrived.
I will confirm each order as it arrives.

73 & GL,

Dale W4OP

Hello Dale,

Your e-mail address is truncated through Yahoo after the @ sign. What is the latter part of your e-mail (is it @...)? Ultimately, I'm interested in a kit.

Thanks,

John Golub

KC8JZO

---In X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> wrote:

I will begin shipping kits on Friday- awaiting padded envelopes that were supposed to be here Monday.

Anyway, here is what I have worked out:
Domestic orders are $11. Foreign orders $13. I really don't want to make money on this, but sure don't want to lose either- I hope everyone will be happy with the priceing

I have all the tiny boards sheared up. Parts will come all packaged together. SMD resistor values are marked. There are only 2 different capacitor values and their physical size distinguishes one from another. The single diode is also unique in its footprint. The larger sized pots are due in today.

I will continue to update the on-line manual but for now- you will need an excellent pair of flush cutters in order to lift pin 5 of the MC1350 RF amp. You must also have already done my AF Gain mod as the additonal 12dB of gain is essential for the AGC. Finally, you will need a small piece of doube sided foam tape- about 1/32" (1mm) thick. I will supply ribbon cable for the 4 hook up leads.

Send payment via PayPal to parinc1@...
BE SURE YOUR POSTAL ADDRESS IS SELECTED IN THE PAYPAL FORM. Also reference X1M AGC in the Subject field.

The larger pots just arrived.
I will confirm each order as it arrives.

73 & GL,

Dale W4OP

2016. SSM2167 Help I'm stuck

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-01 03:37:51 UTC
From: <mr.olson@...>
Topic: 2016 Message: 2016

After getting a SSM2167 Speech Conditioner to work inline with the microphone using external power I went back to one inside the microphone with the LED disconnected. I'm having some problems and I am asking for some help. The diagram is the Photo section in the N9LO folder. It is not in the microphone yet. I am feeding it from a 5 volt regulator like the 5 volts coming into the Tip of the microphone plug. A 1khz 40mv signal is put in at the point where you would connect the positive lead of the electret microphone. The 1N5819 rectifier is my attempt to keep the audio from getting back to the 5 volt + tip. With the switch in the Uncompressed position I can read the input signal on my oscilloscope at test point 1, TP1 and at TP2 which is connected to the 5 volt + plug tip. With the switch in the Compressed position I can still read the signal from TP1 which is now connected the the chip output though a voltage divider but now I read nothing at TP2.

Hi Lee,
The tip which is labled +5- that is coming from inside the radio?
When in compressed postion, what DC voltge do you read on the 5V line?
Do I understand you that currently, the +5VDC line is something like the output of a 7805 regulator?- if so, that is a very, very low impedance point and would squash any audion on the line.

I guess I need more schematic as to what exists at that +5 VDC point.

Hi Lee,
On the radio , the +5 is in series with a 3.3K resistor- which would have to be changed to take into account your current drain.

But if you are looking for audio to be impressed on the output of the 5VDC regulator (if I understand) it won't happen unless you have tons of audio. The output of a 78xx regulator is very very low Z- by design, it has to be that way in order to act as a stiff precision regulator. It likely looks like a short circuit to AC.

2020. A new US$300 HF portable transceiver

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-01 14:56:55 UTC
From: <razvanfatu@...>

HF One MKII is a new HF portable QRP transceiver, packing SDR technology, that costs US$ 300. It is a bit larger than the X1M (about the size of the FT-817) and weights 1.2Kg, but in turn puts out 10W wich might be a good trade. Supports SSB and CW and apparently can be controlled via a smarthpone app.

More details :

I'm
stuck

After getting a SSM2167 Speech Conditioner to work
inline with the
microphone using external power I went back to one
inside the microphone
with the LED disconnected. I'm having some
problems and I am asking
for some help. The diagram is the Photo section in
the N9LO folder. It
is not in the microphone yet. I am feeding it from
a 5 volt regulator
like the 5 volts coming into the Tip of the microphone
plug. A 1khz
40mv signal is put in at the point where you would
connect the positive lead
of the electret microphone. The 1N5819 rectifier
is my attempt to keep
the audio from getting back to the 5 volt + tip.
With the switch in
the Uncompressed position I can read the input signal on
my oscilloscope at
test point 1, TP1 and at TP2 which is connected to the 5
volt + plug
tip. With the switch in the Compressed
position I can still read
the signal from TP1 which is now connected the the chip
output though a
voltage divide r but now I read nothing at TP2.

If I understood Lee, the 7805 is only there temporarily- simulating the 5VDC that is on the tip of the X1M mic socket. But thX1M 5V has an equivalent 3.3K impedance where as the output of the 7805 (his test jig) has close to zero output impedance (0.017 Ohms at 1K). His goal is to eliminate the need for batteries in the mic. So the point is that the voltage that is multiplexed onto the mic line has to have a relatively high impedance when compared to the impedance of that mic line. Here we have 3.3KOhms vs. 0.017 Ohms.

The tip which is labled +5- that is coming from inside the radio?

When in compressed postion, what DC voltge do you read on the 5V line?

Do I understand you that currently, the +5VDC line is something like the output of a 7805 regulator?- if so, that is a very, very low impedance point and would squash any audion on the line.

I guess I need more schematic as to what exists at that +5 VDC point.

Subject: [X1M_QRP-Transceiver] SSM2167 Help I'm stuck

After getting a SSM2167 Speech Conditioner to work inline with the microphone using external power I went back to one inside the microphone with the LED disconnected. I'm having some problems and I am asking for some help. The diagram is the Photo section in the N9LO folder. It is not in the microphone yet. I am feeding it from a 5 volt regulator like the 5 volts coming into the Tip of the microphone plug. A 1khz 40mv signal is put in at the point where you would connect the positive lead of the electret microphone. The 1N5819 rectifier is my attempt to keep the audio from getting back to the 5 volt + tip. With the switch in the Uncompressed position I can read the input signal on my oscilloscope at test point 1, TP1 and at TP2 which is connected to the 5 volt + plug tip. With the switch in the Compressed position I can still read the signal from TP1 which is now connected the the chip output though a voltage divide r but now I read nothing at TP2.

□

If I understood Lee, the 7805 is only there temporarily- simulating the 5VDC that is on the tip of the X1M mic socket. But thX1M 5V has an equivalent 3.3K impedance where as the output of the 7805 (his test jig) has close to zero output impedance (0.017 Ohms at 1K). His goal is to eliminate the need for batteries in the mic. So the point is that the voltage that is multiplexed onto the mic line has to have a relatively high impedance when compared to the impedance of that mic line. Here we have 3.3KOhms vs. 0.017 Ohms.

The latest revision to the manual is now in the Files section. I am including a 1M and a 10M resistor for R4- with explaination in the manual.

I have managed to cut up 600 or so SMD components and have a small assembly line going- so hopefully, everyone gets a full kit.
The padded envelopes are here and I shipped the first 7 kits today. That may not seem like much but I had to fill out customs form for 4 of them. The best news is that the P.O. is willing to ship them w/o custms forms- this will be a huge savings in time- both filling them out and time at the P.O.
I will try to ship 20 more kits on Monday.

THANK YOU DALE , for all you are doing and have done for all of us .

I will put in a plug for Dale's own company
http://www.parelectronics.com <http://www.parelectronics.com/index.php>

He has sacrificed time away from his own company to provide this kit and
it certainly is a not for profit endeavor .

If you choose to order from him , you should also include a HUGE thank
you for what he has done for ALL of us on the X1M overall . Most of you
have no idea how much work , behind the scenes , that he has done to
make owning an X1M a true pleasure .

Success #2!!!! I've got my prototype compression circuit working tonight! Lee -- thanks for your diagram -- I didn't realize I needed to bias the microphone -- although I had wondered how the voltage was going to get there. Turns out my suspicion was correct -- and your diagram told me the answer to my questions! So thanks for that! The other piece I needed to change was the 3v cell button battery out for a 5vc supply with more amperage available.

So at this point I'm getting output and I'll start working on tuning the core feature set and then work on improving it etc. And this rig is still tickling me pink! Giving me reasons to learn :)

That's great Lee! And good eyes Charlie and Dale re: powering from the radio. I'm working on mine with a battery tonight so I'll peak at yours after I give mine it's first run. HA! Glad to hear the punch seems to be really helping the x1m. :)

Thanks Dale, I see that resistor R48C is limiting the current to the mic. I've got the battery-powered one nearly completed. Once done, I'll take a look at lowering that resistor value and building one powered by the X1M. It should easily fit into the X1M stock mic case. My experience so far suggests that a little compression really adds to the average signal power and readability.

Hi Lee,

Measure exactly what your current drain is and change out the resistor that is in series with the 9T voltage that is impressed on the mic socket.

As Charlie pointed out, it is currently 3.3K at least on the schematic.

On 10/28/2013 3:54 PM, lphebus@... mailto:lphebus@... wrote:

I have posted an improved microphone with compression circuit in the photos section, "compression circuit" album. The advantage over the original design is that the compression chip is only active (~3mA current draw) when the mic is keyed. When the mic is not keyed, the chip goes into shutdown mode drawing <2 micro-Amps. My design is a battery-powered (2X AAA) replacement microphone, not a modification of the existing mic or X1M. The circuit mod should greatly extend battery life and allows elimination of the on/off switch.

---In X1M_QRP-Transceiver@yahoogroups.com mailto:X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> mailto:x1m_qrp-transceiver@yahoogroups.com wrote:
I've bread boarded and tested an audio compressor circuit. Pictures are in the "Photos" section. Compression is adjustable from 1:1 to 6.25:1 which seems like plenty to me. It really helps the audio "punch" of the X1M. My plan is to put the circuit in the microphone case with a couple AAA batteries for power. I thought I would use a design like this http://www.qrpkits.com/microphone.html http://www.qrpkits.com/microphone.html . I tried to power it from the +5 volts the socket provides for the electret microphone, but the compressor current draw, although small (<3mA), loaded the 5V down to about 1.7 V. I am surprised by this. The AAA batteries should last a long time however. There are two potentiometers (blue) in the bread boarded circuit. The left is the compression level (Rcomp) and the right is the attenuator adjustment. The output of the compressor chip is a bit too high to feed directly into the X1M.

I bit the bullet and ordered a ssm2167 on a breakout board from them. I decided against soiling my playing with bad soldering fruseration for the moment and instead will forgo the extra coffee one day. I'm thinking and inline version would be the most useful to start out -- plug the mic into the inline box and then have a tail from the board into the rig. There isn't any room in the rig to stick it easily and putting it directly into the mic would limit it to one circuit per mic... also not flexible. The other option is a larger block in the middle of the mic cable but that seems the wrong way.

Anyone have any thoughts on a performed form factor for it?

The more and more I look at this the more and more I want to play with little chip but it is in a tiny tiny MSOP package. And my soldering skills/hand steadiness is NO WHERE near close enough to jump right in. Anyone have a great easy way to put an MSOP chip onto a breadboard or anything like that? I've seen some 'easy' convertors for SMD chips but none for MSOP -- and I guess I haven't looked to see if they would work. Anyway -- if anyone has any great suggestions I'd appreciate it!

Thank Ken! Yup I'm thinking with 5 w I'm going to want the most talk power for the punch of my voice. Although I haven't done the math to see the difference between 0.5w and 5w. if my db brain remembers it probably isn't that much ! much like the difference between 5w and 100w ;) But I suspect it is bigger if I compare 0.5 w to 100w ;) And the goal is to get it as compressed and gained right to point before degrading! And we will see where that lands me! And to top that off the neighbor in the new apartment is really sensitive to me talking at night -- she has come twice at 1am to ask me to keep it down while conversing with a friend at lower than normal voices already. So the more punch I can get out of the mic at lower levels the more I can work in the nighhhhhhht!

And thanks for the thumbs up I'm loving the trip!

Great attitude, Chris! I'm not familiar with that IC, but it sounds as though it has the functions you are seeking. Reasonable compression will add substantially to your "talk power." Like most things, it can be overdone and degrade your signal. Sounds as though you are tackling the learning opportunities this little rig offers with zest and enthusiasm. Have fun and enjoy the trip!

Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

2032. RE: [X1M_QRP-Transceiver] SSM2167 Help I'm stuck

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-02 14:13:39 UTC
From: Lee
Topic: 2016 Message: 2032

Thanks with the help with this, Dale. The test circuit works with 3 AA batteries and even with a 3.3k in series feeding it. I had no idea a voltage regulator could do this to audio. The compressed- uncompressed question I'm going to call, "The mysteries of the electron".

☐

I suspect that signal is a much lower impedance than the output of the compressor. Always difficult to troubleshoot over the internet though.

Do any of you have any idea why the circuit works when the switch is in the uncompressed position and not the compressed position using TP1 and TP2 which was the original question? Shouldn't the regulator eat that signal too?

☐

If I understood Lee, the 7805 is only there temporarily- simulating the 5VDC that is on the tip of the X1M mic socket. But thX1M 5V has an equivalent 3.3K impedance where as the output of the 7805 (his test jig) has close to zero output impedance (0.017 Ohms at 1K). His goal is to eliminate the need for batteries in the mic. So the point is that the voltage that is multiplexed onto the mic line has to have a relatively high impedance when

compared to the impedance of that mic line. Here we have 3.3KOhms vs. 0.017 Ohms.

Lee, How about 2 or 3 diodes in series to drop the battery voltage down to where you want, in place of the 7805?
Roger N4HSI

On 11/1/2013 10:31 AM, Lee wrote:

The Tip is just a label of where it would connect to the plug if I was not using the 5 volts from a 7805 regulator connected to a 9 volt battery for testing. It is not in the microphone yet. When in the compression setting there is 5 volts on the line. Is the 5 volts coming out of the radio during transmit on the Tip line have a higher impedance?

☐

Hi Lee,

The tip which is labled +5- that is coming from inside the radio?

When in compressed postion, what DC voltge do you read on the 5V line?

Do I understand you that currently, the +5VDC line is something like the output of a 7805 regulator?- if so, that is a very, very low impedance point and would squash any audion on the line.

I guess I need more schematic as to what exists at that +5 VDC point.

Subject: [X1M_QRP-Transceiver] SSM2167 Help I'm stuck

After getting a SSM2167 Speech Conditioner to work inline with the microphone using external power I went back to one inside the microphone with the LED disconnected. I'm having some problems and I am asking for some help. The diagram is the Photo section in the N9LO folder. It is not in the microphone yet. I am feeding it from a 5 volt regulator like the 5 volts coming into the Tip of the microphone plug. A 1khz 40mv signal is put in at the point where you would connect the positive lead of the electret microphone. The 1N5819 rectifier is my attempt to keep the audio from getting back to the 5 volt + tip. With the switch in the Uncompressed position I can read the input signal on my oscilloscope at test point 1, TP1 and at TP2 which is connected to the 5 volt + plug tip. With the switch in the Compressed position I can still read the signal from TP1 which is now connected the the chip output though a voltage divide r but now I read nothing at TP2.

Hi everybody!

Just received my ssm2167 and the adapter PCB board converter
from ebay but didn't know they were way too small for my eyes.
There is no way I can solder it and I'm only 45.
Maybe I don't have the right tools to do it.
Where did you buy this little iC already soldered on breakout board?

Thank you

You can have these guy’s order the part from digikey and solder it on a board for you.

http://www.proto-advantage.com/store/product_info.php?products_id=2200031

I’m 59 and here is how I soldered mine. Tape the board down by the edges so it cannot move. Put soldering flux on the board. Hold the IC with a fine needle nose pliers or tweezers and line up the IC so pin 1 is in the right place. With a little solder on your soldering iron tip just touch the tip to pin 1. Check alignment, I use a magnifying glass, and if it is off twist it with very little pressure and reheat pin 1. Now solder pins 6-10 with too much solder so all the pins are covered and when cool do the same with pins 1-5. With de-soldering braid remove the excess from each sets of pins letting the IC cool between de-soldering the other side. Inspect with a magnifying glass and look from a low angel from the pin ends. If you see any solder where it does not belong use a fresh spot on your de-soldering braid. This will leave enough solder between the pin and the board pad to conduct. Clean the board with alcohol and a toothbrush. Check with an ohmmeter from hole to hole around the board for shorted pins like 1-2, 2-3, 3-4, 4-5, 6-7, 7-8, 8-9, 9-10. Next check from board hole 1 to pin one on the IC for continuity and continue around the board.

I uploaded a picture I took with my USB Microscope of one after soldering this way to my N9LO Photo Album. Click on it for a full view.

Lee , thanks for the great tips . I can not do much SMD work I try to get 1210 or 1206 sized parts . I have tremors in my hands much like early Pakinsons , but a little different medical issue . Could you expand on your microscope a bit , since I also have vision issues , all related to some health issues .

I have used the solder wick method successfully in the past . It works as well as anything for me , but I still can't do visual confirmation even when I do get an occasional good day to do SMD work .

Many thanks to you Lee / 7 and the others that have worked on this project .I always enjoy seeing new great little modifications and accessories for this fun rig .

Hopefully once we get the final firmware update and I get my AGC and compressor both installed , I too will be able to contribute some fun projects . I keep a "bench" filter box for all of the different projects that I design and or build , so I am able to put out a nice clean signal on any of the ham bands or experimental frequencies that I operate on . I also have a small "bench" tuner that covers even below 160 meters . Going to try and make some matching accessories for the X1M in one of those matching extruded cases . Will combine as many accessories as possible into a single matching cabinet .

I know of another group member that is working on a nice compact , but very clean output switching power supply . Can't wait to see his results . He is 60 , as I also am :) We "old" guys are having a lot of fun with this rig .

Charlie , W5COV

Selling as a kit is what some small manufacturers do to avoid getting the required certifications for a working finished product. You actually need to install the boards in the case and plug in a few connectors, maybe solder a few wires, pretty much the same thing as with the X1M in kit form.

There was no group for the HF One MKII so I just started one; I will get it going soon, feel free to join it to get the latest news:

HF One MKII is a new HF portable QRP transceiver, packing
SDR technology, that costs US$ 300. It is a bit larger than
the X1M (about the size of the FT-817) and weights 1.2Kg,
but in turn puts out 10W wich might be a good trade.
Supports SSB and CW and apparently can be controlled via a
smarthpone app.

And from what I gather it is a Juma (copy of one) and not an original product at all..the boards that is, the cases if you look at a Yuma are much different.

My contact who is China as I write this has also stated the same thing on this one.

And the other blogs say the same about it, but the price is almost half what Juma costs.

Selling as a kit is what some small manufacturers do to avoid getting the required certifications for a working finished product. You actually need to install the boards in the case and plug in a few connectors, maybe solder a few wires, pretty much the same thing as with the X1M in kit form.

There was no group for the HF One MKII so I just started one; I will get it going soon, feel free to join it to get the latest news:

HF One MKII is a new HF portable QRP transceiver, packing
SDR technology, that costs US$ 300. It is a bit larger than
the X1M (about the size of the FT-817) and weights 1.2Kg,
but in turn puts out 10W wich might be a good trade.
Supports SSB and CW and apparently can be controlled via a
smarthpone app.

2046. RE: A new US$300 HF portable transceiver

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-03 12:05:10 UTC
From: <pezcat19@...>
Topic: 2020 Message: 2046

I want one.

This would be ideal for my 4x4 application - a cheap, rugged and basic HF radio for that price would work very well for me. SDR out is great, too.

$300 is cheap here in VK land. You can not easily (or at all) find a secondhand, modern 'icom / Yaesu / Kenwood' mobile for that money here (in the USA this may be different...)

I will join the new Yahoo group. Thanks for sharing the info on this new rig.

Cheers,

Perrin VK3XPT

2047. Re: [X1M_QRP-Transceiver] RE: A new US$300 HF portable transceiver

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-03 12:44:16 UTC
From: Ken Downs
Topic: 2020 Message: 2047

We'll have to wait and see how it performs. I am most curious whether it covers the "contest-free" bands - 60, 30, 17, and 12 meters, which I prefer, without additional filtering. That's probably my biggest disappointment with the X1M. And for portable/mobile use I'd prefer a good internal antenna tuner to any SDR capabilities. Guess I'm an old fuddy-dud. I don't take a computer (or even a cell-phone) with me everywhere I go.

Topic: 2020 Message: 2049

I suspect that an auto tuner would increase the price of the rig significantly. Although, I agree, it would be useful to have one.

> We'll have to wait and see how it performs. I am most curious whether it covers the "contest-free" bands - 60, 30, 17, and 12 meters, which I prefer, without additional filtering. That's probably my biggest disappointment with the X1M. And for portable/mobile use I'd prefer a good internal antenna tuner to any SDR capabilities. Guess I'm an old fuddy-dud. I don't take a computer (or even a cell-phone) with me everywhere I go.

2051. Re: A new US$300 HF portable transceiver

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-03 13:28:47 UTC
From: Tim W4YN
Topic: 2020 Message: 2051

I have all the Juma kits and the designs are top notch. The signal processing is unique and very effective. It is my top qrp rig and with the amp it is great shack rig. The designers are fantastic, i did have some language problems building the kits but once finished all was fine. another ham rewrote the code and optomized the radio even more.
Tim W4YN
PS if this is true I would buy another!
Tim

I think before I would consider one, I would want to confirm from Juma that the chinese have licensed the design from the Juma group. Too much thievery going on these days. But other than the attractive price, it's just another boring transceiver. I prefer one where I can dig in and make it better- or at least different.

i am just worried about the heft of it. It seems very large and heavy
particularly
when com pared to the x1m. Does it really take that much more s pace to add
5 more watts?

2055. Re: [X1M_QRP-Transceiver] SSM2167 Help I'm stuck

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-03 22:03:33 UTC
From: Dale Parfitt
Topic: 2016 Message: 2055

Hi Lee,
We could be a lot more positive if we were in the same lab. That is my thought though. The regulator should "fight" any ripple/AC or DC fluxuations on its output rail.

Dale

Thanks with the help with this, Dale. The test circuit works with 3 AA batteries and even with a 3.3k in series feeding it. I had no idea a voltage regulator could do this to audio. The compressed- uncompressed question I’m going to call, “The mysteries of the electron”.

☐

I suspect that signal is a much lower impedance than the output of the compressor. Always difficult to troubleshoot over the internet though.

Do any of you have any idea why the circuit works when the switch is in the uncompressed position and not the compressed position using TP1 and TP2 which was the original question? Shouldn’t the regulator eat that signal too?

☐

If I understood Lee, the 7805 is only there temporarily- simulating the 5VDC that is on the tip of the X1M mic socket. But thX1M 5V has an equivalent 3.3K impedance where as the output of the 7805 (his test jig) has close to zero output impedance (0.017 Ohms at 1K). His goal is to eliminate the need for batteries in the mic. So the point is that the voltage that is multiplexed onto the mic line has to have a relatively high impedance when compared to the impedance of that mic line. Here we have 3.3KOhms vs. 0.017 Ohms.

Lee, How about 2 or 3 diodes in series to drop the battery voltage down to where you want, in place of the 7805?
Roger N4HSI

On 11/1/2013 10:31 AM, Lee wrote:

The Tip is just a label of where it would connect to the plug if I was not using the 5 volts from a 7805 regulator connected to a 9 volt battery for testing. It is not in the microphone yet. When in the compression setting there is 5 volts on the line. Is the 5 volts coming out of the radio during transmit on the Tip line have a higher impedance?

Hi Lee,

The tip which is labled +5- that is coming from inside the radio?

When in compressed postion, what DC voltge do you read on the 5V line?

Do I understand you that currently, the +5VDC line is something like the output of a 7805 regulator?- if so, that is a very, very low impedance point and would squash any audion on the line.

I guess I need more schematic as to what exists at that +5 VDC point.

Subject: [X1M_QRP-Transceiver] SSM2167 Help I'm stuck

After getting a SSM2167 Speech Conditioner to work inline with the microphone using external power I went back to one inside the microphone with the LED disconnected. I'm having some problems and I am asking for some help. The diagram is the Photo section in the N9LO folder. It is not in the microphone yet. I am feeding it from a 5 volt regulator like the 5 volts coming into the Tip of the microphone plug. A 1khz 40mv signal is put in at the point where you would connect the positive lead of the electret microphone. The 1N5819 rectifier is my attempt to keep the audio from getting back to the 5 volt + tip. With the switch in the Uncompressed position I can read the input signal on my oscilloscope at test point 1, TP1 and at TP2 which is connected to the 5 volt + plug tip. With the switch in the Compressed position I can still read the signal from TP1 which is now connected the the chip output though a voltage divide r but now I read nothing at TP2.

2056. Re: A new US$300 HF portable transceiver

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-03 23:45:38 UTC
From: Tim W4YN
Topic: 2020 Message: 2056

Adrian 5B4AIY has done much to improve original software so I am sure there are lots of enhancements left to play with. This design has 2 mirco's and dedicated dsp chip, so although not a SDR if is definitly software configurable, also has I&Q out for SDR programs to use and CAT commandable.
I also would not purchase if not licensed from Juma though. The designers have struggled with kitting and have used a subcontractor for kitting, maybe this a means to get around kitting issues and maybe this is a way around it and also to keep cost down.
TX2 has 3 boards and not for faint of hand to assemble due to some of the SMD part spacing, lots of torroid's also hope they do not substitute smd inductors to keep price down.

"Very large and heavy"? it's only approx 6 1/3 x5 x 1 3/4 INCHES and 42 ounces - less than three pounds. I guess these things are relative, but that is still pretty small and light to me. Ever used a radio more than ten years old? Or almost any military radio? I used a 20+ pound backpack HF radio in Vietnam that wasn't one tenth the radio the X1M is. We've come a long way, brother!

From: Dale Parfitt
Topic: 2065 Message: 2065

I am getting a fair number of orders with no USPS shipping address. Please click on "GOODS" and not "SERVICES" when making a PayPal payment.

That ensures your address will accompany the payment.

Also, please tell me in the SUBJECT or Comments field what you are ordering. PAR also sells a number of replacement parts for $11 and $13. This saves me having to send another email requesting this information.

21 kits posting today.

Thanks,

Dale W4OP

Hi Lee,
eBay item # 120957745111

The kit consists of three feet- 2 for the rear so that when the tilt foot is folded up, the radio sits flat.
I have put them on a number of my radios. See my ARK-40 that I converted from thumbwheel to optical encoder:
http://www.parelectronics.com/vintage-ss-engineering-ark-40.php
Previously, I have always attached them with screws, but on the X1M I used JB Weld and they appear to be there forever.

That is a tilt foot. Pretty much identical to what the SGC SG-2020 used. It folds up and then the radio sits flat. But with the tilt foot engaged the radio is tilted at a perfect height and air gets under the rig to help cool it.

I also exchanged the socket head cap screws for black button head screws on the front panel- much nicer look and less obtrusive. Finally, I used my mill to double the number of holes for the speaker- but that is not readily visible in the photo.

Lee , I do NOT recommend removing the screw on the bottom of the rig , unless you securely fasten the nut down on the inside of the case while you have it out of the case . It is pretty nearly impossible to get that nut and screw back in . I was lucky and had the covers off of the filters when I did take that screw and nut out and you can access it then pretty easily , but I also do not recommend taking the shields , only as a last result . Maybe super glue the nut in place or something similar . Dale took his out , but I can't remember how he secured that nut to put it back together .

2068. Re: [X1M_QRP-Transceiver] X1M Tilt Foot and Other Mechanical Changes

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-04 19:12:09 UTC
From: Dale Parfitt
Topic: 1956 Message: 2068

Hi Lee,

I epoxied the nut onto the TO-220 device, which makes putting it back together fairly easy. However, as there is not a lot of spece (height) on the inside bottom, I attached my tilt with JB weld epoxy and that has proved a good solution.

Date: 2013-11-05 14:04:30 UTC
From: <orders@...>
Topic: 1193 Message: 2073

Hi all,

I spent a good portion of Sunday tweaking and testing the circuit with another ham. The short of it is I still don't have a final set of values I'm really happy with but boy am I learning a lot! Swapping in and out parts and seeing how it changes on the screen of the computer is fascinating!

Lee - at one point you mentioned you measured the output of the oringal mic at 40mV. Can you tell me how you did that measurement? I have a trimmer on the output and am calibrating it for the comptuer I'm working with before the radio but I suspect I'm going to have to adjust it f or the radio again -- so I want to reproduce and use your method to start. Thanks.

With that I'm chugging along.....

---In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:

Success #2!!!! I've got my prototype compression circuit working tonight! Lee -- thanks for your diagram -- I didn't realize I needed to bias the microphone -- although I had wondered how the voltage was going to get there. Turns out my suspicion was correct -- and your diagram told me the answer to my questions! So thanks for that! The other piece I needed to change was the 3v cell button battery out for a 5vc supply with more amperage available.

So at this point I'm getting output and I'll start working on tuning the core feature set and then work on improving it etc. And this rig is still tickling me pink! Giving me reasons to learn :)

Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

I put 5 volts between the Tip and Ground on the microphone and fed my oscilloscope with a 100nf capacitor to block the DC. Then I said a medium AAAHHHHH into the stock Microphone and read 40mv Vpp on the scope. If anyone gets different results please let me know. I’m just a hobbyist and no expert.

Subject: [X1M_QRP-Transceiver] RE: Audio Compression 'Accessory Circuit' Idea to Increase SSB Output

Hi all,

I spent a good portion of Sunday tweaking and testing the circuit with another ham. The short of it is I still don't have a final set of values I'm really happy with but boy am I learning a lot! Swapping in and out parts and seeing how it changes on the screen of the computer is fascinating!

Lee - at one point you mentioned you measured the output of the oringal mic at 40mV. Can you tell me how you did that measurement? I have a trimmer on the output and am calibrating it for the comptuer I'm working with before the radio but I suspect I'm going to have to adjust it f or the radio again -- so I want to reproduce and use your method to start. Thanks.

With that I'm chugging along.....

---In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:

Success #2!!!! I've got my prototype compression circuit working tonight! Lee -- thanks for your diagram -- I didn't realize I needed to bias the microphone -- although I had wondered how the voltage was going to get there. Turns out my suspicion was correct -- and your diagram told me the answer to my questions! So thanks for that! The other piece I needed to change was the 3v cell button battery out for a 5vc supply with more amperage available.

So at this point I'm getting output and I'll start working on tuning the core feature set and then work on improving it etc. And this rig is still tickling me pink! Giving me reasons to learn :)

I'm ordering one as soon as the proceeds from a radio sale clear. Is this shipping yet? Any advice?

The last I heard they will ship the next batch some time this month .
Ed, at www.importcommunications.com has the most up to date information
, since he is their largest distributor ..

A little difficult to say Mike. I did not do any before/after testing. But it certainly appeared only a small percentage of the speaker cone was available for moving sound with the original holes.

2079. X1M AGC KITS UPDATE

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-05 22:39:01 UTC
From: Dale Parfitt
Topic: 2079 Message: 2079

Has everyone who wanted a kit now placed their order? If so, I'll set the "production line" on another bench for now. All orders have been filled.

On the subject of manually building with surface mount- I think there is a lot of information on the WEB already . If anyone wants to know the procedures I use, I'll detail it here on the group. No magic, but results in a nice looking board. Perhaps others can chime in with their own SMD techniques.

QRPME.COM has something for circuit boards for surface mount parts. I
recived some cool stuff from them for this for chirstmas last year. 73

I believe you are correct Paul. I just did a search and only saw UK seller that had a set of four.

The manufacturer is OKW Enclosures LTD- perhaps they are available elsewhere.

Hi Mike,
It is all surface mount- 0805 size. Only a dozen or so parts though. I use a Hakko solder station with their pointed tip and 0.015" solder, good tweezers and an illuminated flourescent magnifier.

Hey Dale ,

Where do you get that solder ? I would like to have some smaller diameter on hand too .

I use a 15 watt Radio Shack iron and Radio Shack .022 " solder , 64-013 , Rosin Core , Silver-Bearing solder , mix : 62/36/2 It flows very nicely .

I have it in my reorder cart right now on RS web site . No stores around me so I have to order even Radio Shack stuff , so an even smaller diameter solder would be handy and ordering it is "normal" for me .

I think maybe Paul WMS in Arkansas is on . Looks like a lot of guys are switching frequencies during the week and using 185.3 primarily on weekends . I "think" you will be able to hear me once I get mine back on . Maybe not every night , but most nights now since fall is in full force here right now dropping the leaves from the trees and also the sap is going down so they should so less absorption . There is a part 5 station in Colorado running I think 100 watts on at certain times in the part 15 lowfer section of the band . He makes announcements on the lowfer list , but I haven't figured out a consistent pattern for him yet .

Is there a good source for the tilt feet???

I want to use them on both my X1M and a KN-Q7A.

Dale,
Recieved my kit yesterday, Thank You for that. Put it together tonight and now know for sure my eye's are not in shape for that kind of assembly any longer. The circuit works great Dale and the radio is so much more pleasant to listen to. Thank you so much for designing and making it available to the group.

Regards,

Ray...KD4HJT

☐ Has everyone who wanted a kit now placed their order? If so, I'll set the "production line" on another bench for now. All orders have been filled.

On the subject of manually building with surface mount- I think there is a lot of information on the WEB already . If anyone wants to know the procedures I use, I'll detail it here on the group. No magic, but results in a nice looking board. Perhaps others can chime in with their own SMD techniques.

Fantastic Ray- yours is the first feedback I have had.
If you run the X1M w/o the preamp on 80 and 40M the AGC will respond less to static crashes and other impulses- and of course the rig is less prone to front end overload w/o the preamp. Congrats on getting her together. Any advice to offer other builders?

Very large magnifying glass.
Actually I followed you instructions to the T and everything fit perfectly. The 10 meg R4 option which I went with is very very smooth but a little slow to recover from transmit but I can deal with that as it sounds great. A pleasure to use headphones with it now.

Agreed on the headphones. You could try tacking the 1M on top of the 10M and see if you like that better.

For others who are about to start- refer often to the photo of the populated board to see what goes where, in addition to the silk screen. A nice sharp Exacto knife will aid in removing the film from the SMD packaging and also to hold the part while soldering- although I prefer a pair of tweezers. I secure the PCB in a vice intended for the purpose- you really don't want the board able to move around. I also place a sheet of white paper towel below the vice. If a part gets away from you it will land on the paper towel and will not bounce onto the floor.

I tin one end of the SMD part and solder that end first. If it is not square to the board you can use the tweezers to reposition the part as you reheat that end.

Often not discussed is tombstoning of SMD parts. Briefly, this refers to the part not sitting flush with the board. So, once you have the first end tacked down- look at the board from a side view. If the part is not flush, put your index fingernail on the part and reheat- you'll feel the part move toward the board and sit flat.

Spot on Ray- I have done it that way also.

I just added another page to the build manual in the Files section. Page 7 is a hi res photo of the finished board. I also added highlights to show the orientation of the MC1350 and D1 to make their placement more obvious.

☐ Agreed on the headphones. You could try tacking the 1M on top of the 10M and see if you like that better.

For others who are about to start- refer often to the photo of the populated board to see what goes where, in addition to the silk screen. A nice sharp Exacto knife will aid in removing the film from the SMD packaging and also to hold the part while soldering- although I prefer a pair of tweezers. I secure the PCB in a vice intended for the purpose- you really don't want the board able to move around. I also place a sheet of white paper towel below the vice. If a part gets away from you it will land on the paper towel and will not bounce onto the floor.

I tin one end of the SMD part and solder that end first. If it is not square to the board you can use the tweezers to reposition the part as you reheat that end.

Often not discussed is tombstoning of SMD parts. Briefly, this refers to the part not sitting flush with the board. So, once you have the first end tacked down- look at the board from a side view. If the part is not flush, put your index fingernail on the part and reheat- you'll feel the part move toward the board and sit flat.

Very large magnifying glass.
Actually I followed you instructions to the T and everything fit perfectly. The 10 meg R4 option which I went with is very very smooth but a little slow to recover from transmit but I can deal with that as it sounds great. A pleasure to use headphones with it now.

Ray

Dale,
Recieved my kit yesterday, Thank You for that. Put it together tonight and now know for sure my eye's are not in shape for that kind of assembly any longer. The circuit works great Dale and the radio is so much more pleasant to listen to. Thank you so much for designing and making it available to the group.

Regards,

Ray...KD4HJT

Dale,
Is the decay time proportional to the value of R4 or is it either fast or slow? Say I put a 5meg in there should it be half the time as the 10meg?

Ray...KD4HJT

2109. RE: Increased RX Gain

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-07 19:08:53 UTC
From: <lphebus@...>
Topic: 1304 Message: 2109

A quick question on the "increased RX gain mod". I conclude from looking at the schematic, that this mod also increases the audio level at the headphone jack. I'm pretty sure this is the case, but thought I would ask just to be certain.

I use the headphone output for digital modes, so I will need additional attenuation iif there is an increase. Thanks...

I have been very busy here, but now that we have sufficient system gain, I have laid out an AGC circuit that should be easy to implement. Once finalized, I'll make up 30 or so SMD boards- about half the size of a postage stamp. Only 4 connections- +12, GND, AF in and AGC control voltage to the MC1350.
So let's hope the ckt performs as expected.

☐

I have been very busy here, but now that we have sufficient system gain, I have laid out an AGC circuit that should be easy to implement. Once finalized, I'll make up 30 or so SMD boards- about half the size of a postage stamp. Only 4 connections- +12, GND, AF in and AGC control voltage to the MC1350.
So let's hope the ckt performs as expected.

From: <lphebus@...>
Topic: 1311 Message: 2112

Dale, Have you seen my TX audio spectrum graphs in the photo album " USB and LSB on an SDR"?

The RX graph was generated as you suggested, and you commented on it back in Sept. It shows shows graphically what we all hear with our ears, the RX SSB audio is very nice on the X1M!

I also posted (somewhat later) a TX SSB filtering graph. To generate it, I used an audio frequency signal generator that puts out a constant amplitude signal (mVrms). I ran the X1M into a 50 ohm dummy load and put an oscilloscope on the output. From the Vrms of the output and the 50 ohm load, I calculated Watts output. First I adjusted the audio drive so that at peak frequency, the output was about 5 Watts (for the X1M it was about 1200 Hz). Then keeping this audio drive amplitude constant, I measured the Watts output at 100 Hz steps. I ran 3 separate curves which were averaged for each sideband. They were very similar.

I also generated a similar graph for my MST-40 QRP transceiver (LSB only) for comparison.

I have been getting signal reports saying that my X1M audio is weak and lacks higher frequencies. That fits well with the TX SSB filter graphs described above. After all this explanation, my question is "How do these data fit with your impression/tests?" (you mentioned you were going to run a TX filter test a while ago)... and "Do you think this is something that can be adjusted in the software or is it more likely a property of the hardware filter?" Sorry for the long message. Any opinions welcome!

GA Lee,

I don't have a pony in this race, but from looking at the two graphs you mentioned, the RX bandwidth looks considerably wider than the TX bandwidth your graph shows. Your TX bandwidth is a function of not only the crystal filter bandwidth of the rig but also any audio shaping or response issues in the TX audio chain and the exact placement of your BFO frequencies relative to the sides of the crystal filter. Maybe changing your BFO frequency settings might help a little with your audio bandwidth, etc. FWIW.

Hi Lee,
Yes, I have seen your graphs- very nice. I have not had any tme to do anything with my spectrum analyzer to date. Just way too much going on.
I don't believe there is anything in firmware that will alter the SSB TX response (other than perhpas moving the carrier insertion point) - it's all hardware driven. I have received reports from locals saying the audio is restricted in both highs and lows and assumed it was:
1. The microphone
2. The shape of the crystal filter.
3. Carrier insertion point
I have no idea whether the manufacturers are trying to match xtals for the filter. It does sound awfully good on RX.
I would like to look into this more, but am awfully busy at this time. Seems a lot of companies have spare budget money and want to spend it on RF filters before year's end.

Dale, in the "photos" section there is an album titled "USB and LSB on an SDR". In it are 3 images of the X1M side bands as seen on a SDR waterfall...

X1M = the radio as received from the vendor
X1M after by ear alignment = after the youtube video alignment method
X1M aligned according to manual = balanced by ear then fine tuned using ARGO software
See the original post in this thread for details...

Also, take a look at the RX side bands graph!

I hope I have answered the question you were asking ;-)

Hi Dale,
Nice little kit. Did I mention that it is little? Besides the usual small iron tip and fine solder, the two tools that enable me to work with surface mount parts are a good magnifier (I use the OptiVisor, head band style) and a holding jig that was the subject of an article in QST, July 2000. I was published again in the book 'More QRP Power'. The jig has a movable arm that is spring loaded to hold the tiny parts in place on the circuit board while leaving both hands free to solder. The swivel/slide action of the arm allows it to reach any part of even a fairly large circuit board. Mine is made from junk box scraps and doesn't look as nice as the one in the magazine, but functions just as well. I put several photos in the Photos section of the Yahoo Group.

Thanks for your help.

Hi Lee,
Yes, I have seen your graphs- very nice. I have not had any tme to do anything with my spectrum analyzer to date. Just way too much going on.
I don't believe there is anything in firmware that will alter the SSB TX response (other than perhpas moving the carrier insertion point) - it's all hardware driven. I have received reports from locals saying the audio is restricted in both highs and lows and assumed it was:
1. The microphone
2. The shape of the crystal filter.
3. Carrier insertion point
I have no idea whether the manufacturers are trying to match xtals for the filter. It does sound awfully good on RX.
I would like to look into this more, but am awfully busy at this time. Seems a lot of companies have spare budget money and want to spend it on RF filters before year's end.

Subject: [X1M_QRP-Transceiver] RE: RE: Sidebands on SDR

Dale, Have you seen my TX audio spectrum graphs in the photo album " USB and LSB on an SDR"?

The RX graph was generated as you suggested, and you commented on it back in Sept. It shows shows graphically what we all hear with our ears, the RX SSB audio is very nice on the X1M!

I also posted (somewhat later) a TX SSB filtering graph. To generate it, I used an audio frequency signal generator that puts out a constant amplitude signal (mVrms). I ran the X1M into a 50 ohm dummy load and put an oscilloscope on the output. From the Vrms of the output and the 50 ohm load, I calculated Watts output. First I adjusted the audio drive so that at peak frequency, the output was about 5 Watts (for the X1M it was about 1200 Hz). Then keeping this audio drive amplitude constant, I measured the Watts output at 100 Hz steps. I ran 3 separate curves which were averaged for each sideband. They were very similar.

I also generated a similar graph for my MST-40 QRP transceiver (LSB only) for comparison.

I have been getting signal reports saying that my X1M audio is weak and lacks higher frequencies. That fits well with the TX SSB filter graphs described above. After all this explanation, my question is "How do these data fit with your impression/tests?" (you mentioned you were going to run a TX filter test a while ago)... and "Do you think this is something that can be adjusted in the software or is it more likely a property of the hardware filter?" Sorry for the long message. Any opinions welcome!

Very nice. I have to build one of these. No more burnt fingers.

Subject: [X1M_QRP-Transceiver] RE: X1M AGC KITS UPDATE

Hi Dale,

Nice little kit. Did I mention that it is little? Besides the usual small iron tip and fine solder, the two tools that enable me to work with surface mount parts are a good magnifier (I use the OptiVisor, head band style) and a holding jig that was the subject of an article in QST, July 2000. I was published again in the book 'More QRP Power'. The jig has a movable arm that is spring loaded to hold the tiny parts in place on the circuit board while leaving both hands free to solder. The swivel/slide action of the arm allows it to reach any part of even a fairly large circuit board. Mine is made from junk box scraps and doesn't look as nice as the one in the magazine, but functions just as well. I put several photos in the Photos section of the Yahoo Group.

Thanks for your help.

Has everyone who wanted a kit now placed their order? If so, I'll set the "production line" on another bench for now. All orders have been filled.

On the subject of manually building with surface mount- I think there is a lot of information on the WEB already . If anyone wants to know the procedures I use, I'll detail it here on the group. No magic, but results in a nice looking board. Perhaps others can chime in with their own SMD techniques.

Hi Lee,
Thanks. And, my hands are not as steady as when I was younger, but the 'finger' on the jig doesn't shake. When you make the finger, it works best if the tip end is a small flat. Not rounded. An old mouse pad glued to the baseboard, grippy rubber side up keeps the board from moving. Some pads cut from the mouse pad used as feet under the jig keeps the whole thing from sliding around on the bench.

Glad to hear you like the antenna. You can also remove the factory radiator and put any half wave wire on the matchbox from 60M to 10M and use it monoband.

Well I am kind of ashamed to admit it since so many others on here are using the EFHW with the X1M with great results , that I don't own one YET !!

That , especially a multiband model like you have Lee is going to change pretty shortly . One thing that I have a real shortage of is antennas , especially ones that easy to erect and also resonant ones .

For many years as a ham I never even owned a tuner and only got one at first because it was part of a "package" that I traded for . Now I am very dependent on one until I can get new antennas and replace the old ones .

From reading what the people on here are saying the EFHW and the X1M make a great complimentary pair .

Dale's current line of antennas , the HF Omnianges are some really outstanding antennas !!! If you want some serious omnidirectional pattern antennas then the Omniangles are the way to go .

I have the Trail Friendly version 40/20/10 End Fedz, max 25 watt power. I ordered a 35-40 watt amplifier so now I'm looking into making the antenna work with another toroid and capacitor. I'm going to try an FT140-43 toroid and MFJ air variable capacitor to handle the amplified power.

Hi Victor ,

Dale sold the PAR EFHW line of his antennas and they are now being manufactured and sold by :

http://www.lnrprecision.com/

Dale has a current line of antennas that start at HF and go into the UHF region . VERY GOOD antennas with another of his own innovative designs . They are called Omniangles .

They have a true omnidirectional pattern and I enjoy that feature , since I no longer have to worry about a rotor quitting on the tower , or freezing up in the middle of the winter when I am trying to operate and also I don't have to take time to wait on rotating a beam or other directional antenna during contests , or when a DX station suddenly pops up.

I started out with a 17 meter omniangle and the X1M and have been able to add several new countries , most on the first call , since I have had it . I plan on having one for every band that he has available . It takes a phillips screwdriver and less than 15 minutes to assemble and it is very lightweight , but made of high durability , extremely high quality materials and can easily be erected by one person . They too , like his original EFHW line can be used on other bands by simply quickly changing the matching box .

Here is the URL for the HF line of them :

http://www.parelectronics.com/hf-omnis.php

He also has other products designed and built by his company :

http://www.parelectronics.com

You know the designer , owner , and builder , (DALE , W4OP) and can see the superb service and time he devotes to helping amateurs all over the world from his work and posts on the X1M and all of the many hours he has also spent behind the scenes that only a few people are aware of , on the testing and making suggestions on the software , hardware , firmware and even accessories (developing and paying for the AGC prototypes out of his own pocket , plus kitting and selling the AGC kits at no profit , just for his cost) for this little jewel of a rig , that he has no financial interest in , to make it a real radio , that we can all be proud to own now .

He did all of the work on the X1M on his own time , at his own expense , and even took many hours away from his own business , that he makes his living from , to help all of us and to make this a fine little rig that

easily compares with radios that cost at least twice as much as the X1M does .

Usual disclaimer for me , no financial interest , etc. etc. just one VERY HAPPY & SATISFIED USER AND CUSTOMER !!! I have never even met Dale in person .

I have always bought yaesu. With that being said, I have had very bad luck on the service side of this hobby. That includes whatever accessories I have purchased from other vendors. That all changed when I bought my KX3. What an incredible operation the folks at elecraft have running. Excellent product with top notch service.
It appears that I'm in for another great experience. I look forward to continuing supporting Dale and also Import Communications with my business.

From: <lphebus@...>
Topic: 2124 Message: 2132

I left the X1M (attached to a netbook via a USB digital interface running WSPR software) on all night with a 10% transmit and 90% receive schedule. As I mentioned before, the antenna was a multiband end fedz up about 10 feet between my house and a tree. The rig was fine, and in the morning, when I looked at the contacts, I had lots in the continental US and Canada, 3 in Japan and 4 in Australia (27 stations received and 30 receiving my transmissions). I see this as proof the X1M can handle digital modes and the required 2 minute 100% duty cycle transmissions. I'm going to try some PSK-31 this afternoon.

http://www.lnrprecision.com/ http://www.lnrprecision.com/

Dale has a current line of antennas that start at HF and go into the UHF region . VERY GOOD antennas with another of his own innovative designs . They are called Omniangles .

They have a true omnidirectional pattern and I enjoy that feature , since I no longer have to worry about a rotor quitting on the tower , or freezing up in the middle of the winter when I am trying to operate and also I don't have to take time to wait on rotating a beam or other directional antenna during contests , or when a DX station suddenly pops up.

I started out with a 17 meter omniangle and the X1M and have been able to add several new countries , most on the first call , since I have had it . I plan on having one for every band that he has available . It takes a phillips screwdriver and less than 15 minutes to assemble and it is very lightweight , but made of high durability , extremely high quality materials and can easily be erected by one person . They too , like his original EFHW line can be used on other bands by simply quickly changing the matching box .

Here is the URL for the HF line of them :

http://www.parelectronics.com/hf-omnis.php http://www.parelectronics.com/hf-omnis.php

He also has other products designed and built by his company :

http://www.parelectronics.com http://www.parelectronics.com

You know the designer , owner , and builder , (DALE , W4OP) and can see the superb service and time he devotes to helping amateurs all over the world from his work and posts on the X1M and all of the many hours he has also spent behind the scenes that only a few people are aware of , on the testing and making suggestions on the software , hardware , firmware and even accessories (developing and paying for the AGC prototypes out of his own pocket , plus kitting and selling the AGC kits at no profit , just for his cost) for this little jewel of a rig , that he has no financial interest in , to make it a real radio , that we can all be proud to own now .

He did all of the work on the X1M on his own time , at his own expense , and even took many hours away from his own business , that he makes his living from , to help all of us and to make this a fine little rig that easily compares with radios that cost at least twice as much as the X1M does .

Usual disclaimer for me , no financial interest , etc. etc. just one VERY HAPPY & SATISFIED USER AND CUSTOMER !!! I have never even met Dale in person .

2135. [X1M_QRP-Transceiver] THOUGHTS AND REFLECTIONS

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-08 19:18:35 UTC
From: Charlie , W5COV
Topic: 2135 Message: 2135

Lee , thanks for that information . I have only run my X1M on WSPR and QRSS a couple of nights , while it was attended. It was early on when I first started playing with it and was doing testing of different modes and at that time issues with the X1M . I also found the slowest QRSS stations that were on the air and able to be heard here at that time of the year to look at stability . I did run some overnight captures when doing that . The results were excellent !!

Well I haven't been on the digital modes for a few months now with it , since I still haven't put the case back on it yet . Still have the AGC board to install and will probably leave the case off until the final firmware update is installed , just in case , that I need to access something one last time on the inside .

Once I get my beacons and antennas for them all up and operating for the winter season , I will probably fire the spectrum analyzer up and do some more extensive tests , especially looking at the filter . Thanks for the plots that you have done . It is really great that so many people on this group has pooled all of their particular areas of expertise and the ones of us with specialized test equipment , taking their time and putting that equipment , some of which is quite specialized , and many of us with good test equipment , still don't have some of the equipment that has been used by these people to aid in locating the root cause of an issue and not just putting a band aid on it , but rather developing a permanent change and fix for it .

Ed has been just fantastic (www.importcommunications.com) at working with those of us that have spent a lot of time playing with the radio and identifying the problems . We were able to keep in contact with him and he in turn was able to deal with the factory in China , and not only somehow explain it from English to Chinese and getting them to understand the actual problem and then most important of all , he was able to actually get them to make the needed changes , just as we had located them and again not taking shortcuts , but actually taking advice from us and Ed and implementing the changes to the best engineering change that was able to be made .

I don't think many people will argue that the X1M did have a number of important issues when they first came out . However the company has been so willing to make the changes , that it is more of a radio , than what most of us actually ordered . It has a few extra features now and certainly when you compare the price of a fully assembled full 5 watt QRP multi mode transceiver , there isn't anything in the world that I am aware of that even comes close to it .

Another nice thing is they didn't forget the owners of the original X1M's and they can now easily and rather cheaply upgrade those to a full featured X1M PRO (Platinum) . Ed's warranty service has been excellent and that is Ed alone providing that , as far as I know , since the last I knew the factory didn't have a good warranty service in place , as it related to their distributors . Also the company has not yet geared up enough to be able yet to keep a continuous flow of radios to their distributors , so Ed really is doing a much better job on backing the warranty than most people know and again that has been done ALL ON HIS OWN. That alone speaks VERY HIGHLY to why a person should buy through a reputable distributor .

This radio already has quite a history and also quite a back story to get to the point that it is at today . A great little rig , in my personal opinion .

The group members have been and continue to be the best source of feedback and developing on their own some very useful accessories to use with the radio . I am quite certain we will see this trend continue to grow and it is a great list for one person helping another . There is a whole world of accessories that can be designed , built and added to personalize your X1M for your particular use .

The NEW USB to DB-9 cable that Ed has now , is a HUGE improvement for using the X1M with HRD and doing firmware updates !!! Also the small in physical size , made to match the radio , filter from Xiegu , that Ed also handles , is a GREAT addition especially to CW and Digital mode operators . It can also be used on SSB.

Okay I now I talk way too much , but a LOT of you people that make up this group and the excellent work Ed has done and is continuing to do , deserved to be posted so at least some of the "NEW" group members could get a brief history and background for this radio .

Can hardly wait until the next shipment comes in and we see many "new" faces on here . Hope they are sending Ed a LOT of these radios , which should arrive in time for Christmas :)

THANKS TO EVERYONE ON THIS GROUP !!! Now start spending more time on the air on the mode of your choice with the X1M , since once the company can produce enough radios to meet the demand , I want to work every other X1M owners that I possibly can. Hey when more of them get into the hands of active users we might even need to form an informal set of awards for different accomplishments made while using just the X1M :)

Best 73 , Charlie , W5COV

GA Charlie,

Thanks for the background info, etc on the X1M.

I am one of the new group members and I don't have my X1M yet. Hopefully Santa will deliver it before Christmas. It is on order.

You mentioned a USB to DB9 adaptor for remote control and firm ware updates. I have a question. From the pictures on the user's group site it looks like there is another very short cable used between the adaptor and the rig. Is that basically a null modem or a gender bender?

Thanks.

From: Charlie , W5COV
Topic: 2135 Message: 2138

No Dave that cable has a 232 chip inside the plug cover . It is a level converter since the X1M requires true TTL level signals . The new cable on Ed's site eliminates all of the hodge podge of cables that are required to use even the short cable . The new cable goes from USB to the required TTL levels on the DB9 plug on the X1M . Much easier , just hook one end to the computer and the other to the radio . Just leave it hooked up and you can use the X1M with the Ham Radio Deluxe control feature .

2139. RE: Mic suggestions

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-08 19:16:19 UTC
From: <mikejmardis@...>
Topic: 2115 Message: 2139

In addition to mic options, what are people using for an swr meter. Something pretty accurate and can tuck away in my backpack for field use I'm ordering an elecraft T1 auto tuner. I also ordered the filter from Ed when I ordered the radio. AGC kit ordered. Any other suggestions for getting the most of the little miracle?

Thank you Charlie. This group has really gotten me excited about this radio. I even pulled out some old unfinished kits to brush up for the agc kit.
I would definitely be interest in a monthly/weekly CW/SSB net when I get the radio. QRPARCI has some interesting awards that could be implemented. I would be more than willing to manage it.

I also found the slowest QRSS stations that were on the air and able to be heard here at that time of the year to look at stability . I did run some overnight captures when doing that . The results were excellent !!
>
> Well I haven't been on the digital modes for a few months now with it , since I still haven't put the case back on it yet . Still have the AGC board to install and will probably leave the case off until the final firmware update is installed , just in case , that I need to access something one last time on the inside .
>
> Once I get my beacons and antennas for them all up and operating for the winter season , I will probably fire the spectrum analyzer up and do some more extensive tests , especially looking at the filter . Thanks for the plots that you have done . It is really great that so many people on this group has pooled all of their particular areas of expertise and the ones of us with specialized test equipment , taking their time and putting that equipment , some of which is quite specialized , and many of us with good test equipment , still don't have some of the equipment that has been used by these people to aid in locating the root cause of an issue and not just putting a band aid on it , but rather developing a permanent change and fix for it .
>
> Ed has been just fantastic (www.importcommunications.com) at working with those of us that have spent a lot of time playing with the radio and identifying the problems . We were able to keep in contact with him and he in turn was able to deal with the factory in China , and not only somehow explain it from English to Chinese and getting them to understand the actual problem and then most important of all , he was able to actually get them to make the needed changes , just as we had located them and again not taking shortcuts , but actually taking advice from us and Ed and implementing the changes to the best engineering change that was able to be made .
>
> I don't think many people will argue that the X1M did have a number of important issues when they first came out . However the company has been so willing to make the changes , that it is more of a radio , than what most of us actually ordered . It has a few extra features now and certainly when you compare the price of a fully assembled full 5 watt QRP multi mode transceiver , there isn't anything in the world that I am aware of that even comes close to it .
>
> Another nice thing is they didn't forget the owners of the original X1M's and they can now easily and rather cheaply upgrade those to a full featured X1M PRO (Platinum) . Ed's warranty service has been excellent and that is Ed alone providing that , as far as I know , since the last I knew the factory didn't have a good warranty service in place , as it related to their distributors . Also the company has not yet geared up enough to be able yet to keep a continuous flow of radios to their distributors , so Ed really is doing a much better job on backing the warranty than most people know and again that has been done ALL ON HIS OWN. That alone speaks VERY HIGHLY to why a person should buy through a

reputable distributor .
>
> This radio already has quite a history and also quite a back story to get to the point that it is at today . A great little rig , in my personal opinion .
>
> The group members have been and continue to be the best source of feedback and developing on their own some very useful accessories to use with the radio . I am quite certain we will see this trend continue to grow and it is a great list for one person helping another . There is a whole world of accessories that can be designed , built and added to personalize your X1M for your particular use .
>
> The NEW USB to DB-9 cable that Ed has now , is a HUGE improvement for using the X1M with HRD and doing firmware updates !!! Also the small in physical size , made to match the radio , filter from Xiegu , that Ed also handles , is a GREAT addition especially to CW and Digital mode operators . It can also be used on SSB.
>
> Okay I now I talk way too much , but a LOT of you people that make up this group and the excellent work Ed has done and is continuing to do , deserved to be posted so at least some of the "NEW" group members could get a brief history and background for this radio .
>
> Can hardly wait until the next shipment comes in and we see many "new" faces on here . Hope they are sending Ed a LOT of these radios , which should arrive in time for Christmas :)
>
> THANKS TO EVERYONE ON THIS GROUP !!! Now start spending more time on the air on the mode of your choice with the X1M , since once the company can produce enough radios to meet the demand , I want to work every other X1M owners that I possibly can. Hey when more of them get into the hands of active users we might even need to form an informal set of awards for different accomplishments made while using just the X1M :)

2141. Re: [X1M_QRP-Transceiver] RE: Mic suggestions

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-08 21:56:16 UTC
From: Charlie , W5COV
Topic: 2115 Message: 2141

I can't make a suggestion for backpack operation , since my main use is at home and from motels , so weight is not a consideration . However I am quite certain we have other group members that can address that issue .

There are a couple of other nice little accessories if you operate SSB or the digital modes . Two different Lee's one a /9 and one a /7 , have both successfully built a speech processor that will actually fit inside of the microphone that comes with the radio . A really nice addition to get the most "average power" output on phone.

Lee /7 has built an interface for digital modes , using a modem that costs 2 or 3 dollars , plus a few other parts for you to feed right in the microphone jack . Looks like a nice addition if you want to get even more out of the X1M by running the digital modes . One day when my eyes and hand tremors permit it , I am going to attempt to build me one , because I do enjoy the digital modes .

Paul has built an adapter out of an old ethernet cable to use for interfacing his SignaLink USB to the X1M .

I believe there are pictures of all of these in either the files or photos section of the group and they are all active members of the group if you have any questions .

Naturally you can roll your own low pass filters to put between the X1M and the antenna to use it on any of the other ham bands not covered and or filters for the part 5 and part 15 experimental bands , or build you a box and a switch with different filters to cover other bands without having to change the external filter each time that you want to switch to a non included band .

If you haven't read the archives , the microphone can be modified for a bit better audio . VERY VERY CAREFULLY take the back off of the microphone and I just cut the speaker completely out of mine , since it isn't used anyway . You will find the electret element in one corne pretty much enclose in a small cavity. I took a sharp exacto knife and cut about a 1/4 wide opening between the mic cavity and the area that housed the speaker . The PTT bar has some VERY tiny pins molded on it to pivot on so be very careful not to damage those.

Several other ideas , but I'll not monopolize things , and let some of the other guys add their suggestions and experiences .

Charlie

Thank you Charlie. Please don't hesitate to recommend anything or share your experiences with me. That goes for EVERYBODY!!!!
I'm sure, in short order, there will be a multitude of new owners very soon.
Every bodies experience and suggestions will be well served.

cant you just use the rs232 for receive and transmit. Why do you need an additional interface for digital modes

I think that if the RS-232 were going away anytime soon, Elecraft would not be still using it on their Flagship K3 transceiver. I am not a digital guru at all, but RS-232 is a rock hard standard.

Always a bit of confusion here....

The RS-232 connection on the back of the X1M does two things:

1. Allows you to control frequency, various settings. This is what
HRD software does for you.
2. Upgrade firmware.

HOWEVER, to run digital modes, you need to create/decode, etc. the
information from and to your computer. This needs:

1. A sound card
2. Someway to generate the PTT signal to key up the transceiver.
3. Software -- DM780, as part of the HRD suite or ANY OTHER decent
digital mode software.

A typical interface -- my favorite is the SignaLink USB -- has BOTH the
sound card, and the PTT stuff. Hence, you connect the SignaLink to the
microphone jack for input to the radio, and patch the headphone jack to
the input to the SignaLink.

Those are two quite different issues -- controlling the X1M (or any
other transceiver), and dealing with the digital modes.

For example, I run digital modes on my Alinco DX-SR8 <gasp>. It has NO
control mechanism (not quite, but essentially true) for the radio. I
tune manually, and then provide the digital signal to the microphone
jack on the Alinco, and pull the digital signal from the speaker jack.

I am actually using the same SignaLink unit for both my X1M and and
Alinco -- all I had to do was make up an Ethernet jumper from the
SignaLink to the X1M, using the same pinout as the Alinco configuration.
Thus, I didn't have to go into the SignaLink and change any jumpers, etc.

I use the little absorptive SWR bridge from QRPKits, or <gasp> a "CB" SWR meter from Vanco. Rat Shack sells one as well.

I have the QRPKits one in a box with a switchable dummy load, and a peak-reading diode circuit to check power level. The QRPKits one, of course, is the smallest. It all depends on how paranoid you are about your finals.

Hello folks. Ordered my X1M Pro on Thursday from UK 'Moonraker' I'm not sure how long these have been available here in the UK but I'd never heard of them until Thursday and there doesn't seem to be a lot of UK activity on here. Hopefully mine will arrive early next week so I can start having some fun. I've only just joined but I've read an awful lot of the threads and looked through all the files, very interesting stuff. Thanks guys. 73. Mel. M5ZZR

Do you mean this one http://www.qrpkits.com/swrindicator.html
http://www.qrpkits.com/swrindicator.html

I have it and I like it.

Even better is this very small tuner that incorporates the same SWR meter with a polyvaricon-based QRP antenna tuner http://www.qrpkits.com/sota.html
http://www.qrpkits.com/sota.html

And finally, this http://emtech.steadynet.com/zm2.shtml
http://emtech.steadynet.com/zm2.shtml is a really nice tuner - SWR meter that is a bit bigger. Check out the 55 reviews on eham.net (average 4.9/5)
http://www.eham.net/reviews/detail/445 http://www.eham.net/reviews/detail/445

I can't help it, I appear to be a "collector"!

I've been doing this, although some might shudder. So far it works. I am mounting a surface mount part, like a 10 pin 0.5 mm pitch voice processor, on a breakout board. The same should apply for a circuit board. First I apply some flux from a flux pen to the pads of the board. I then tin the pads with a bit of additional solder, being careful to avoid or correct any solder bridges. This adds a thicker layer of solder to the pads. Then I apply a bit of flux to the pins of the chip. I then mix up a very small batch of JB Weld epoxy. I put a tiny dab of the epoxy where the "belly" of the chip lies, in an area with no contacts. This works well for chips of the classic bug conformation, where legs extend from both sides. I then carefully place the chip on the board with the legs "perfectly" aligned on the pads. If needed, I push it around a bit. The JB Weld takes perhaps an hour to start solidifying, so there is some time to get the chip perfectly aligned with its feet on the pads. I use a 10X loupe magnifying instrument (see ebay). Push down on the chip to make sure the feet are on the pads... look closely! Let the epoxy dry. Once the epoxy is dry, take a fine tipped soldering iron and heat the "feet" of the chip until solder flows. I do not apply additional solder at this time. Check your connections with a multimeter. So far so good for me... just my experience.

---In X1M_QRP-Transceiver@yahoogroups.com, <r-mason@...> wrote:

Hi Lee,
Thanks. And, my hands are not as steady as when I was younger, but the 'finger' on the jig doesn't shake. When you make the finger, it works best if the tip end is a small flat. Not rounded. An old mouse pad glued to the baseboard, grippy rubber side up keeps the board from moving. Some pads cut from the mouse pad used as feet under the jig keeps the whole thing from sliding around on the bench.

Hi Dale,
Nice little kit. Did I mention that it is little? Besides the usual small iron tip and fine solder, the two tools that enable me to work with surface mount parts are a good magnifier (I use the OptiVisor, head band style) and a holding jig that was the subject of an article in QST, July 2000. I was published again in the book 'More QRP Power'. The jig has a movable arm that is spring loaded to hold the tiny parts in place on the circuit board while leaving both hands free to solder. The swivel/slide action of the arm allows it to

reach any part of even a fairly large circuit board. Mine is made from junk box scraps and doesn't look as nice as the one in the magazine, but functions just as well. I put several photos in the Photos section of the Yahoo Group.

Thanks for your help.

Has everyone who wanted a kit now placed their order? If so, I'll set the "production line" on another bench for now. All orders have been filled.

On the subject of manually building with surface mount- I think there is a lot of information on the WEB already . If anyone wants to know the procedures I use, I'll detail it here on the group. No magic, but results in a nice looking board. Perhaps others can chime in with their own SMD techniques.

Very interesting Mel . Can you give us a link to where you bought it ?? As far as I knew there were not any available at the present time , awaiting the company to start another production run . I do think now they are going to have to do one of two things , make MUCH larger production runs , or run the "production line" MUCH more often than they have been doing in the past . Once the news gets around that the company has listened and made the needed improvements , plus the suggested improvements , this radio "should" be difficult for Distributors to keep in stock.

It was my understanding that there were only two authorized distributors in the world . WIMO for Germany , and Ed the largest distributor for them in the world , at Import Communications , http://www.importcommunications.com here in the USA . I know he has invested a VERY substantial amount of money and time to make it the product that it is today and buys the largest quantities of them . There are at least a couple in the UK , because some friends of mine bought them from Ed when they were here in the country visiting .

The final firmware revision has yet to be released too . Also I am sure there are many owners of the original X1M's waiting to be able to get their hands on the updated front and display , that Ed is also handling , to bring their radios up to the current level just like they were purchasing the entire radio , instead of just the up to date front panel assembly . The price for that upgrade looked like a great buy for the difference that it will make in the radio .

This is a GREAT group and many people on here know the radio extremely well , both inside and out , so you will find plenty of support available on here .

Looking forward to when you get your radio in hand . Might have to set up a schedule so we X1M owners , can add the UK to our X1M countries worked :)

Agreed on the ZM2 tuner. Very nice and matches most anything quickly. I use mine a lot.

There is also a Chinese QRP tuner kit being sold on eBay for about $20 shipped that is a T-match using poly-varicons and has the LED SWR indicator circuit in it. It's an easy build and works very well but the little red LED was too dim for me to see in daylight. Replacing it with a wide viewing angle and larger LED fixed that problem after adding 5 turns to the secondary of the small toroid that powers the LED. And, remove the .01u bypass cap between the 1N60 diode and ground.

Also have a small CB type meter I sometimes use with QRP rigs. I find that they are not sensitive enough to give a full scale FWD reading below 15 or 20 meters. To fix that I have replaced the resistors at either end of the strip line (usually they are 150 Ohm or so) with 1k Ohm, PC board style variable trimmer resistors. Dial in enough resistance to bring the meter up to full scale on 80 meters while set in FWD, then measure the value of that resistor and adjust the other variable on the REF end of the strip line to match. Double check it to be sure you get a 1:1 when hooked into a 50 Ohm load.

I confess to being 'a collector' too, but my wife says I'm just a pack rat.

Hi Mel and welcome to the group,

I own one but it is still in the USA with a fellow ham awaiting his next trip over here, I was not aware that Moonraker stocked them. However after some digging around their web site I found :-

http://www.moonraker.eu/amateur-radio-1/transceivers-and-brand-accessories/base-transceiver/all-other-base-transceiver/x1m-platinum-5-band-qrp-80-10m-hf-transceiver

The price seems pretty reasonable. I hope that you enjoy the radio. And as Charlie says this is one of the more friendly and productive newsgroups around.

If WIMO do have the distribution rights for the EU it might be advisable for others to buy from Moonraker pretty quickly. WIMO have a reputation for protecting their turf!

I checked the ~$20 QRP tuner kit on eBay, and I guess the description (below) say s it all.

"Just Kit For Diy!!
This kit requires some soldering electronic technology, will recognize the device, it will weld, the basic need debugging, as long as careful assembly according to package instructions can succeed. If the novice find weld on the error, intended to build the first not handle, please contact customer service personnel will get the appropriate technical guidance.
This kit welding, making easy to understand, easier to learn, easy to use. Comes with standing instructions, Q9 type interface (such as the need to be self to M-type interface), using T-topology networks, QRP facilitate communication with the low-power transceiver (shoes, frogs, octopus, etc.) used to make transceiver and antenna valid match, meet your emission requirements, ensure a highly efficient radio communications."

I for one can't wait for my first QRP contact with a shoe or a frog, and an octopus would have to be something special I'm guessing????

Regards,

Ian VK3YIC

At least they have a decent diagram for it and the price doesn't seem too bad .

Anyone know of a source of cheap poly-varicons these days ? My source of poly-varicons has dried up so I don't build many QRP tuners these days and it also limits what receivers I can build .(Roger , I think in the case of these I am going to be one step deeper and be a hoarder and not just a sensible collector) <grin>

I am sure among all of us in the group that we could design a decent small tuner and maybe do a group buy of parts , then like with the AGC , we would all be on the "same page" to help out new owners and builders . Maybe even paint and a decal to "match" the X1M :)

2163. Re: THOUGHTS AND REFLECTIONS

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-09 13:59:30 UTC
From: Paul W. Ross
Topic: 2135 Message: 2163

The RS-232 standard is for DIGITAL information only. It was designed originally for such things as modems. There are two versions -- 25 pin (rarely found, lots of extra control signals), and the 9 pin. In reality, you only need three wires -- data in, data out, and ground (not counting how you do "handshaking"). It has generally been supplanted by the USB connector -- data in, data out, ground, and +5volts. The "handshaking" is then done by software.

The problem with the RS-232 on the X1M is that the signal levels are NOT the standard for "real" RS-232. A level converter is needed. There are two versions of the X1M interface:

1. Old version -- just converts between "X1M" levels and standard RS-232 levels -- you need an additional RS-232 to USB converter.

2. Old better -- does BOTH in one unit. The converter is in the grey shell on the RS-232 end of the cable.

Again, if you want audio, you get it from the X1M Headphone jack, and input to the microphone jack. PTT is one of the pins on the microphone jack. See the "User's guide" for the pin out.

BTW, when I get my replacement for my defunct X1M, I'll revise the manual to reflect these issues, and any changes due to the new firmware.

Truthfully, a "T" match is the better bet, as it has a better tuning range. However, you have two parameters to match (resistance and reactance), and THREE variables on a "T" match, so there is no unique setting. I have an MFJ-901 "Travel Tuner," and you adjust that for a match, then attempt to reduce the "L" value and re-tune, if possible. The loss is in the inductance, and you want to minimize that.

That sounds like a really good deal, Paul. The tuner is an easy build, one fairly large toroid to wind with taps, a small circuit board for the swr circuit, a few holes to drill in the case, etc. There is a seller on eBay selling the same tuner completed for near $90. Note that it is offered in two versions, either BNC or SO-239 connectors. The supplied case label is in Chinese, so most of us need to come up with something different. I had planned to buy a second one and build it as a Z-match, but hit upon a good deal on a ZM-2. I couldn't collect all the parts for the $20 price of the kit.

I know Dale is thinking about the tuner losses vs. using a resonant antenna :-)

Would an octopus be an 8 element antenna?? Gain? Front to Back ratio?

Hi Charlie, Steve, Andy n all. It's very good to meet you all. I purchased mine via Ebay - the seller was Moonraker. They also have them listed on their website. I don't know how many they have left?

I have an IC-703 but I was looking for a kit - something a bit more 'home-brew' and trail friendly. One band, CW only, would have satisfied me but I couldn't find a kit I liked; I have been on the lookout for some time.

Then! On Thursday I saw this. I knew absolutely nothing about it. I'd never heard of it before but could hardly believe the specs so I purchased it straight away. They had 6 on offer at the time and I purchased the 3rd.

Of course I started researching what I'd purchased after the event and it was then that I realised what a little gem I'd acquired.

I hope to get delivery Mon - Wed and will let the group know how I get on. It will exceed my expectations that's for sure, given my original plan was a kit along 'Walford' lines. Anyway in preparation for the day I've knocked up a rather nice EFHWA a la 'Diana En'.

Aren't we lucky? Mel. M5ZZR

> In addition to mic options, what are people using for an swr meter. Something pretty accurate and can tuck away in my backpack for field use I'm ordering an elecraft T1 auto tuner. I also ordered the filter from Ed when I ordered the radio. AGC kit ordered. Any other suggestions for getting the most of the little miracle?

I've not got my X1M yet - it should be here in a day or two. I've recently finished building a Forward/Reverse power meter from Kanga kits UK called the 'Oner' My plan is to use this for SWR measurement. It's very small and it could have been constructed even smaller, I used enclosure and MC meter I hade in my junk box. Full scale fwd reading at 100mW, maximum input 10w. Mel. M5ZZR.

I had to take one turn off of the toroid to get it to tune up to 20 meters. Now does 40/30/20 within the range of the capacitor.

For poly-varicons you might try Dan's Small Parts. 73

Hi, OM
How much my Amplifier?
It is my own version of Mike WA2EBY and Virgil K5OOR constructions:
http://www.golddredgervideo.com/kc0wox/wa2ebyamp/amppart1.pdf

http://site.hfprojectsyahoo.com/yahoo_site_admin/assets/docs/HFPackerAmp3.227113959.pdf
It contains an linear amplifier, LPF's , 12 V DC to 25 V DC x 7 Amp
converter and automatic cooling control system.
Sorry, this rig is very expensive for me, as is made by myself (if you
asked about price (?).
Such an amplifier is very good "helper" for any qrp transceiver.

Ed has Xiegu building an amplifier to match with the X1M , IF a person wants to add an amp and also have one that should match the looks of the radio .

Dale listed a place on eBay , that sells the matching extrusions for the X1M , so a person could build their own amp , make a matching filter box for all the other bands , build an antenna tuner / SWR / WATT METER ,external speaker , power supply , digital mode interface , all sorts of projects that are easy to build and can be made to match the looks of the radio . You could even combine one or two projects in the same box . Power MOSFETS are pretty cheap if you want to do some design and experimenting and come in all different values , and require a pretty minimal number of other parts to build an amplifier all the way up to the 100 watt range pretty easily .

It is a great little radio to use as the center piece to let your imagination run wild and start building and learning new things along the way . A person could make an entire desk line up of all matching accessories , just like all of the "big boy radio manufacturers from Japan" offer to "show off" a beautiful little station .

Build yourself a "big gun" contester style headset with boom mike , out of one of the very very plentiful computer headsets , that can be picked up for a song . Get creative and build a desk mike to the scale of the radio , like a D-104 or a Shure 444 . Add a cheap digital clock / timer to one of your X1M station accessories that you build . Maybe 2 clocks , one on UTC and one on local time .

These are just some general ideas that come to mind to use it as a "base station" radio . You could probably get even fancier with Arduino and other such platforms , for even more projects .

2187. Headphones and the X1M: Heil Traveler?

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-10 02:17:44 UTC
From: David Moisan
Topic: 2187 Message: 2187

I am shopping for my first HF rig after being an Extra for nearly 20 years without HF. The Xiegu is perhaps the first rig I've seen that I have any chance of buying. I nearly got an Icom 703 a few years ago but thanks to a new revision of the radio (this was some 10 years ago) and the Yen rate, I could not pull the trigger on it. I'm in an apartment and have never been on HF. ☹

I have a Heil Traveler headset with the Kenwood HT adapter. (I volunteered at the Boston Marathon for years with this headset. I loved it. If it could block noise there for this hearing-impaired operator, it can work anywhere!)

It's a given that I would obtain a new adapter for this headset. (For those who don't own Heil headsets, they are terminated to a 9-pin microphone plug that is itself mated to an adapter you buy for the radio you are using with it.) I'm well aware that Kenwood *does things essentially differently* from the other makes I have owned and used (all the big three plus ADI).

Anyone used a Heil, or know of the closest match for this headset and the X1M? (I have had to grind the original Heil Kenwood adapter to fit my TH-F6A and stay plugged in there, so I'm not afraid of "tear it apart". ☺)

2188. RS-232 Level converter

Topic: 2188 Message: 2188

I wonder if anyone's tried a FTDI Friend from www.adafruit.com<http://www.adafruit.com>? This is a board with a mini USB on one end and headers on the other. TTL level RS232 signals go in on the headers, and come out on USB.

I do not, of course, own an X1M, but I would gladly use the board in place of all the Mickey Mouse stuff I've seen over the years for dealing with TTL and RS232. All of the problems of rig control virtually disappear! FTDI is a very reliable RS-232 chipset and FTDI parts are readily available for scratch designs.

Hi David ,

Welcome to a fine group of people that will help you in any way possible to get you up and running and having an absolute ball with the X1M . It was also the first new HF rig that I have bought in a great many years and I just love this little jewel .

Sorry that I can't be of any help with the Heil , but I am quite sure several people on the group have experience with Heil and their products .

I don't know how many radios that Ed will be getting in the scheduled November shipment . As well as the radio is working these days , it is becoming more popular by the day and expect to see a HUGE spike in the number of people ordering them , especially once this latest firmware edition one gets into the hand of users.

You might want to check with Ed to see if he has a more firm shipping date and what his status is tentatively to the number of people that already have them on order , to insure that he will have plenty of stock to sell , since also they should arrive "just in time for Christmas shoppers" so probably a lot of people have it on their Christmas wish list .

When you get one , let us know and we'll be happy to help with any questions that you might have .

Charlie , W5COV

I've had good luck with adafruit products, but have no experience with that particular item. I have a few "USB BUB" boards from "moderndevice.com" I have 3 of these and they work well for me in rig control (ICOM 7000) and as an arduino programming interface http://moderndevice.com/product/usb-bub-i/ http://moderndevice.com/product/usb-bub-i/ . (they have a version 2 also with a few differences, all FTDI-based). I suspect the adafruit will work like the USB BUB.

Lee , I am working on a project right now that contains several pieces from Adafruit . It uses one of their GPS receivers . She is a smart lady and keeps lots of good products for experimenters .

Lee , Paul , and others , I need some advice on what is the most simple , cheapest , and most versatile platform for someone to learn programming on again ? I used to do it daily as a part of my job , mainly Atmel based projects , prior to my brain injury and "living" in various hospitals for a couple of years .

I have almost no memory at all of that work , so cheap and simple are key words . I am "managing" with pickaxe right now , but want to move on and learn more again so I can do more things to let the X1M communicate with different devices in the outside world .

There are so many now I really don't know which one to use as a starter back into digital work .

I wonder if anyone’s tried a FTDI Friend from www.adafruit.com http://www.adafruit.com? This is a board with a mini USB on one end and headers on the other. TTL level RS232 signals go in on the headers, and come out on USB.

I do not, of course, own an X1M, but I would gladly use the board in place of all the Mickey Mouse stuff I’ve seen over the years for dealing with TTL and RS232. All of the problems of rig control virtually disappear! FTDI is a very reliable RS-232 chipset and FTDI parts are readily available for scratch designs.

No real problem other than different regulations in different countries . Even in Australia , I don't know your rules well enough to know the technical standards . Here in the USA you have to be familiar with a lot of FCC rules and dates for the equipment being built and used , plus whether it is indeed home built or a commercially built radio .Also what frequencies it will be capable of operating on .
Buy you a cheap breadboard , some cheap power transistors like an IRF 510 , since you are likely to smoke a couple in the learning process , but they are less than a buck each . Look around on the net and you will find many simple designs to get you started .
I have the X1M and a Yaesu FT-707S , that I have no desire at all to raise the power on . Instead of an amplifier for them I prefer better antennas and feedlines .

You're right on one thing: It's a bewildering world. My day job is in IT, but I am well familiar with all the little dev boards out there.

Most people seem to have to make two choices: Go Small—with the Arduino and other like devices—or go Big—with the Raspberry Pi, Beaglebone and similar devices. I've owned just about all the major dev boards except the Arduino.

All of the boards are "cheap". When Embedded Systems Conference used to be in Boston (RIP. ☹) I would get demo boards for free, and one year I bought a Zilog Encore board—and traded it in years later for a TI Chronos watch.

The distinction is that the Arduinos go small. They are low-level chips that are designed to be programmed by people new to microcontrollers. They are programmed in a synthetic language similar to Java. The API, and the capacity, of the Arduino is limited by design, but it is very broadly supported in the Maker universe. You will probably do what you need to do for most radio control applications but you might need to write some low-level glue functions and you will not have an operating system as you know it.

A big plus for the Arduino is that it is very easy to setup a toolchain, a task that would stymie newbies and even some experienced devs.

The Arduino is not a fast board. Some applications, such as SDR, are flat out not possible with Arduino-class boards.

For Microsoft IT pros and developers, I found the Netduino a very interesting board; it's an Arduino-compatible board that runs .Net Micro Edition. If you know C♯ even casually, this is a fine board and they've released a new version a while back which I haven't tried.

The Pi and the Beaglebone "go big"; they are effectively small-scale Linux machines that run on ARM. They are also broadly supported, and if you are an experienced Linux user, you will be in familiar territory. The Raspberry Pi was the first "cheap" Linux board, and it was specifically designed to provide a simple environment for teens interested in computers. As an old teen myself who started in just this way, it's a great endeavor indeed, and at $35, it's worth having one or more of these around the shack.

The Beaglebone (now in the Black revision) has much more I/O and processor capacity than the Pi at just a bit more ($45), but at the expense of some ease of use. I've owned an original Beaglebone for a while and it is a very nice board, but the developers are trying to integrate their Linux kernel with the mainline Linux kernel and this has caused a lot of teething pains in the last year as the board support is dramatically different from the last generation. I can deal with these things as my day job makes me jaded to it, but I'm not sure I can yet recommend the Beaglebone to a new user.

The Pi can and does SDR applications, but the processor capacity had to be compromised to meet the Pi Foundation's original BOM costs. The Beaglebone has plenty of CPU and has even been used for video processing.

There is broad and relatively stable peripheral support for these boards. The Arduino and the Beaglebone have expansion slots and cards; Arduino have “shields” that plug in and add I/O functionality. Beaglebones have “Capes”, the same concept under a different name. The Pi has a single plug-in IDC connector for I/O, and it is the relatively weaker sister of the three in that regard.

Your choice may depend on whether you want to go from bottom-up development, with the Arduinos, or top-down development, with the Pi and Beaglebone. Both of these alternatives have widespread community support. It may also depend on what tasks you’re inclined to do with it. Arduinos will handle most simple rig-control problems, as will the Pi as well. But if you need to host an SDR server, Arduinos will not do this. Many Linux ham radio applications can be compiled for the ARM, yet another compelling consideration.

Good luck. I sit on my town’s Commission on Disabilities and I have several dear colleagues who’ve suffered brain injuries. (And one of my co-chairpersons is blind. And an Extra. ☺)

Lee , I am working on a project right now that contains several pieces from Adafruit . It uses one of their GPS receivers . She is a smart lady and keeps lots of good products for experimenters .

Lee , Paul , and others , I need some advice on what is the most simple , cheapest , and most versatile platform for someone to learn programming on again ? I used to do it daily as a part of my job , mainly Atmel based projects , prior to my brain injury and "living" in various hospitals for a couple of years .

I have almost no memory at all of that work , so cheap and simple are key words . I am "managing" with pickaxe right now , but want to move on and learn more again so I can do more things to let the X1M communicate with different devices in the outside world .

There are so many now I really don't know which one to use as a starter back into digital work .

That does make the situation a bit more difficult , but with the brain trust on this group , I am certain they can come up with some innovative ideas to help you . Another problem in adding an amp , is if you went to 10 watts for 3dB of gain , will it put you to the point that you then can't hear the stations calling you . There is always a trade off , but then hams are known for being innovative and finding a way to overcome most of the trade offs.

I haven't really taken much time to study the final section in the X1M , other than taking all of the low pass filters off of the board and measuring them and counting turns on the toroids , in both models .

Have a look at the schematic and also study the data sheet on the final , maybe you will find something by doing that .

I have a Microchip based device I’ve modified (an NTP UTC clock which unfortunately is out of production) and they seem to be really a world unto themselves. I’ve used everything else but a Picaxe. If Charlie can use a board without downloading a 2 Gig toolchain, he’s probably ahead of the game.

These guys put out really excellent kits . Very good price too , 20 watt amplifier for $50 !! It should certainly be plenty of power for the X1M , if a person really wants a little boost from true QRP operation . I also like their choice of transistor . Although the IRF 510 and up series is cheap and has served me very well as a learning tool , the new transistor is a much better choice , at least from the spec sheets . I recently bought some to experiment with and will probably stick with them over the IRF series . There also is very little difference in the price between the transistors .

Sure will be interested in how it goes for you Lee and what the output signal looks like . I would like to see a diagram of it , to see what , if any changes they made when they changed to this new transistor . If it works out , I may buy one and modify it for the 600 / 630 meter bands .

I also am interested in their multi band filter boards . Those look like they might make a nice accessory for the X1M also .

Thanks for sharing the link. I don't check their site often enough .

I would suggest the Arduino for learning to program -- subset of C.
Another possibility is Python, and run the Raspberry Pi, but that is
significantly more complex.

Hi Charlie,

I used to program and design systems for a living. So this is my take on the subject.

I am very fond of the Arduino system and its clones. But it is not an ideal platform for learning to program. This goes for pretty much all embedded systems. As well as learning to program you have to juggle the hardware as well and it is often the case that you need to learn how to use debugging tools and it can be quite a challenge to get them running. For example the Arduino clone Energia running on the MSP430 had big problems with OS/X and i never managed to get the Serial debugging to work. Without this i could not easily see what was going on inside the chip.

Were it me i would download one of the free C programming environments and use that to start off with along with a good Textbook on C. When i was a windoze user i liked http://www.bloodshed.net/devcpp.html for C learning and the matching book by Larry Ullman "C programming Visual Quickstart Guide" . Work through the book and get a feel for the subject. Write a couple of command line applications and get them running. Then you should understand enough to start with Arduino ect. If you learn C well its a good start for other programming languages and most microcontrollers and operating systems support it. This is not true of most other programming languages. Personally i would avoid learning assembler or machine code and BASIC. The first two tie you to one arcitecture and ideally you should be able to work with many.

2207. RE: [X1M_QRP-Transceiver] AMPLIFIER /FILTER KITS

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-10 16:00:11 UTC
From: Lee
Topic: 2203 Message: 2207

More info can be found in the AQRP Yahoo Group in his folder, K5BCQ. I bought the heat sink from him and ordered the case he suggested from its manufacturer. I bought a Dual Band Pass Filter from Kits and Parts as I mostly use 20 and 40 meters.

Subject: Re: [X1M_QRP-Transceiver] AMPLIFIER /FILTER KITS

These guys put out really excellent kits . Very good price too , 20 watt amplifier for $50 !! It should certainly be plenty of power for the X1M , if a person really wants a little boost from true QRP operation . I also like their choice of transistor . Although the IRF 510 and up series is cheap and has served me very well as a learning tool , the new transistor is a much better choice , at least from the spec sheets . I recently bought some to experiment with and will probably stick with them over the IRF series . There also is very little difference in the price between the transistors .

Sure will be interested in how it goes for you Lee and what the output signal looks like . I would like to see a diagram of it , to see what , if any changes they made when they changed to this new transistor . If it works out , I may buy one and modify it for the 600 / 630 meter bands .

I also am interested in their multi band filter boards . Those look like they might make a nice accessory for the X1M also .

Thanks for sharing the link. I don't check their site often enough .

Compilers are good enough that it's best not to be concerned about low level assembler. You can always look at the generated assembler code if need be.

I would disagree in part about learning to code on a command line, or more specifically, somewhere other than the problem area one wants to learn on. The Arduino has a simple toolchain to set up; I have a collection of '430 boards and the Chronos watch and I know it is not fun to get a toolchain running for these, even on Linux. The 'duinos seem to be the best devices in this regard. A lot of nontechnical artist types have gotten their projects going on them.

We always tell newbie coders to start with a Hello World program-something that prints "Hello, World" on the screen. Why not blink an LED? That is the equivalent in embedded systems, as you know. That leads right to my second point.

I cannot learn only from theory. I studied DSP's from the moment I saw the first chapter on DSP in an old ARRL Handbook, around the early 1990's or so.

I never, ever, really understood DSP at all in all that time.

Not until I got my first SDR two years ago. Now I get it, and it only took 20 years (!!) I am a very technical and highly motivated person, and not lazy. I learn many things in my day job in IT, all day, every day (now, if my workday were < 24 hours a day...)

But until I needed to solve a problem, there was no sense reading about a problem; I'd forget it, and if I never needed to learn that, it'd be useless. Mind you, the greatest pleasure I have is reading old technical material (thank you, Internet Archive, thank you, Bitsavers, thank you, BAMA!) so don't think that I am too lazy to read. (Just too busy. :( )

I would suggest, Charlie, that you go ahead and try an Arduino. Blink an LED with it. Put a scope on a pin and see how many times you can toggle the I/O pin and how fast. Make a ersatz PWM modulator. That's the only way to really know if you can do it. You could learn Windows (or Linux) programming, but life's too short.

And get yourself a PI so you can use the radio software already out there and get some exposure to an interesting platform that we will see a lot of in amateur radio.

2209. Flip Bail Radio Stand

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-10 17:56:44 UTC
From: <r-mason@...>
Topic: 2209 Message: 2209

Just added some photos of my latest attempt at a useable stand for the X1M. I'm happy with this one. It is the traditional 'flip bail' type of stand. Nothing fancy, the material for the brackets was cut from a scrap of the front panel of a Radio Shack project box. The wire for the bail is from a coat hanger :-) It attaches by the two lower screws that hold the front panel on the radio. So, no need to drill the radio, easily reverseable, no special tools needed (tin snips, drill, pliers), cheap. Pardon my lack of artistic ability, but I think you can get an idea of the concept from the sketch and photos. It could be prettier, of course. Maybe I will find some stainless or plated wire for the bail.

Nice job Roger !! First on my list is your Surface Mount parts holder . That is really clever and an ABSOLUTE MUST HAVE for me to be able to continue to work with pretty much any size SMD's these days .

This is a really great and innovative group for sharing ideas and people helping people .

Thanks to everyone on their advice on programming and platforms . I didn't lose all of my memory related to programming , but I do have some gaps and holes in it .

Basically I am an old analog guy these days , but the X1M excited me from the first time that I saw it . After my 48th anniversary in ham radio , this month , not much excites me , so I am pretty prejudice and fond of the X1M for getting me once again involved in more modern technology and learning again , or learning new things about the current state of electronics .

At first I always said it was a decent radio for the price . Well we no longer need to add the for the price phrase . It is a great little radio and will be even better with the final firmware update . I am certainly happy that I got in on it "near the very beginning." It has been thrilling and exciting to be a part of and see the evolution of this NO TOY HERE radio !!

I have not been able to afford to buy a new HF ham rig in many years , so the price was also an important factor in my owning one . Many pretty much no name , minimal kits , that are usually CW only and put out 1 watt , maybe 2 two watts if you are lucky sell for more than this completely assembled full 5 watt , multi mode QRP transceiver and many of the kit companies and or owners are pretty much non cooperative if you have an issue that needs to be addressed .

Since I may never be able to afford to buy a brand new HF rig again , I am going to devote a lot of time to building accessories to go with the X1M . I have so many accessories in mind , I could take an entire winter doing nothing but building accessories to customize it for my own personal style of operation .

I am a VERY AVID MF/LF/VLF operator , both transmitting and receiving . This radio is also perfect for that . IF the FCC and ARRL ever move forward on getting the grant approved for a 630 meter ham band and a 2200 meter ham band , we are just a couple of simple cheap and easy to build projects away from getting right on the air with the X1M . How many of the even very high dollar rigs can even say that ?? I do wish they would open it up so it would cover down to say 50 kHz. , for using WWVB as a SID reference monitor and also allow coverage of the 4,000

meter band .

I have the sketch done and the parts gathered up , to add a 6 meter transverter to my X1M , probably hold off until spring to really work on that . Again simple cheap and easy for a very neat and interesting band .

PLEASE keep on putting your ideas and projects out there to share with everyone . We all have different skills and interests so your idea may indeed inspire some of the rest of us to build and use it too .

2217. X1M So-Far

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-11 19:32:55 UTC
From: <neilgoldstein@...>
Topic: 2217 Message: 2217

This is just a general wrap-up of everything I have done with my X1M original model to date.

1. QRP Go-kit: I purchased a used custom foam case, and tore out more foam to fit all of the accessories, radio, cord and antenna wires.

2. Tuner: Using the excellent ZM-2 tuner from Emtech

3. Antenna: I have an assortment of 16 gauge wire lengths that I hang when I'm portable, using the water bottle method, or whatever MacGuyver procedures are available given the location

4. Audio: I have not performed the audio mod. I use a tiny powered speaker, which is about the size of a golf ball. Works well.

5. Microphone: Like many of you, I had trouble with the mic connector. I re-soldered and sealed the connection.

6. Out-of supplied filter-range use: For the top part of 80 and 40, I'll wait for the firmware upgrade for the older model. I tested the radio on 17 and 12 on my Elmer's service monitor. 17 was pretty bad. For 17 I am going to order a low-pass filter kit from Kits-and-Parts. 12 was actually pretty clean on the monitor. I had a QSO with Lithuania on 12 a couple of weeks ago, while operating portable.

7. CAT cable: I made a cable by using a CP2102 USB to TTL module from eBay ($2.79 shipped). I semi-permanently connected a USB extension cable to it to get some length, sealing it on with heat-shrink. Then, on the other end I decided I wanted some break-out capability for being able to tie-in to the other 5 pins later on. We've seen in the schematic that they are connected to the LPF/BPF circuits, but I don't think anyone has implemented anything yet. I purchased a D-SUB9 male to RJ45 adapter and connected the pins 1-to-1, 2-to-2 etc. For the initial cable I made the 3 necessary connections to half of a CAT5 cable that I split in two, and tied it to the CP2102 interface, leaving the extra 5 wires for later use. I know I could of just tied it all directly to a D-SUB but this way I have some quick-disconnect options in the field. It works with HRD in Windows, and FLDIGI in Mac, Windows, and Linux. So far so good.

8. "Tune Button": I got tired of carrying around a full straight key just to tune-up. My first implementation of this is just a tiny click-on-off button heat-shrinked directly into the back of a 3.5mm plug. Later I'll move it inside the rig.

9. Power: First, I lugged around one of those jump-start kits. It worked great, as I think I could run the X1M off of this monster for a week or more. At the last LIMARC Ham Fair here on Long Island the "battery guy" was selling these small 4-amp battery packs. Just a bunch of Li-ion cells wrapped with a 12V accessory socket and a charging circuit. Came with a wall-brick charger. Great little battery. I'd post a link, but it's not on their web site. I'll post the model # and company contact in a future post as well as a picture in case anyone wants to order one. I think it was $40. It even powers my HTX-10, or any of my

dual-band VHF-UHF mobiles (on low power)

10. Future: I pre-ordered the upgrade kit from Ed at Import Communications. Looking forward to that, and the firmware upgrade. I'm planning on a SingaLink USB interface or the SCI-6 from Unified Micro for digital modes. Once I have everything the way I want it, I may replace the garage-sale case with a real one. I'm considering an amp. possibly the HardRock 50 kit.

DX Contacts (all SSB):
10M: Guadeloupe, Antigua, DR, Fr. Guiana, Argentina, Columbia, UK, Mexico
12M: Lithuania
15M: Venezuela, Germany, Denmark, UK, Scotland, Azores, Ukraine, Slovenia
20M: PEI Canada, Czech Rep, Denmark

I'm happy with this.

2220. LOWFER BEACON TEST

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-12 00:49:18 UTC
From: Charlie , W5COV
Topic: 2220 Message: 2220

If any of you care to have something to do tonight , I have put my home built beacon on the air 24/7 . Right now it is just for some testing as I am finishing up a new beacon . It is not on my full legal limit length transmitting antenna , but my test antenna does a decent job out to about 500 miles .

The X1M is capable of receiving on this frequency , but like most ham transceivers , is lacking in sensitivity in this range , so I HIGHLY recommend at a very minimum an amplified antenna such as the PA0RDT E-probe or mini whip . Also a good buffer for impedance transformation and an amplifier or external preamp will give you hours of listening fun on the X1M for the 2200 , 1750 , 630 , 600 meter experimental bands and also give you a preview of what to expect IF we ever get ARRL/FCC approval for a ham band at 630 meters and now looking less likely , another ham band on 2200 meters .

Besides ham and experimental activity you may get hooked on "chasing" NDB's , NAVTEX , Foreign Broadcast stations and all manner of stations that occupy the frequencies between 100 kHz. and 510 kHz.

Here is the link to a page that has many simple , cheap , and easy projects you can put together easily in one evening to explore this and even the frequencies below the coverage range (100 kHz.) on the X1M . It is a home hobbyist electronics page and has a wide range of simple , clever , cheap , and easy to build projects for the home hobbyist . It has a matching Yahoo group . called techlib where you will find all of the support for ANY of these projects that you might find of interest . The designer of all the projects offers his personal , as extensive as you require , support for all of these projects . It is a free site and has some really nice "outside of the box building blocks" in case you want to "roll your own" project . The URL is http://www.techlib.com be sure and also check the circuits tab at the top of the page too .

My beacon is running QRSS60 , 24/7 , and is on 185.2984 kHz. with the identifier of CV

Most people start out listening to QRSS and also NDB's with a free program called ARGO , a program designed for weak signal work . It can be downloaded from this URL http://www.weaksignals.com/

There are several free NAVTEX decoder programs out there . If you have any questions , please feel free to ask me .

Just another way to get closer to maximum fun out of the X1M .

Looking for you now Charlie in QRSS60. The HP3586B is spot on within better than 0.1Hz- so if you are there, I'll find you.

I am seeing a signal just into the noise- hopefully it will pick up just a bit. Freq= 185.1384KHz. I think my loop may be nulled a bit toward you- so I'll rotate it around. Even though this is skywave, it may help a dB or so- that's all the more signal I need to make out the ID.

Man what a weather change here since earlier . I now have about a 40 MPH wind out of the north and the vertical wire radiator is swinging in the wind and the loading is changing as it moves around . Something I am going to have to stabilize better some day and I don't know for sure when that will be.

The high here today was 71 degrees and it is supposed to be from 16 to 24 by morning !!!! Then more wind so the chill factor is going to be downright cold . Haven't seen how long until it is supposed to warm up again .

Saw the 600 meter guys were giving it up for the evening and one station was going to give 630 a try , due to very poor conditions . However just saw a couple of posts for 74 kHz. and signals look great on that band .

Will be leaving the beacon on 24/7 .

Guess I will play with the X1M and see if I can add a state or two or maybe even a couple of new countries .

An interesting use for the X1M Charlie and one that certainly drew my interest to the radio as soon as it was announced. I haven't seen any advertising of the kit version recently. Can anybody throw any light on its availability?

I know that the cost difference was marginal but there is just a little lingering feeling of guilt for me in buying ready-built rigs. Even a little bit of personal input to the assembly process seems closer to our amateur radio heritage.

Hi Bill ,

Many of us on here share the interest of MF/LF listening and in my particular case also transmitting . Almost everyone who tries it this time of year is immediately hooked on it . My main interest these days is from basically DC - 2 MHz.

During the day if those frequencies are dead then I find time to do some hamming on the other bands .

Like you , some of us are old school hams . I celebrate being licensed for 48 years , this month . I still build regularly , today for experimenting and fun mainly , unlike when I became a ham at age 12 where I did it out of necessity and spent many fun filled days doing curb and landfill "shopping" on my bicycle to find all of the new treasure trove of parts that were put out for the trash .

I don't know if there is a kit version of the X1M or whatever the kit was called , even available for sale today . It is not a project that I could even begin to undertake , given some health issues and the size of SMD's used in it . I saw several bad stories about the kit and especially the drawings and the instructions .

However all is not completely lost . One can build the AGC kit that is available to put inside the X1M and naturally the audio mod has to be done before you can use the AGC kit . I am sure that there are other mods that people will find and do as more technical people get the radio . I have generated a long list of accessories that I could build for the X1M and make it a full base setup with all of the matching accessories like the big Japanese companies have made over the years to fill the desktop with all matching accessories to go with their rigs .

When I was able to confirm that the X1M would indeed transmit on 137 kHz. , I ordered mine the next day . Naturally I had different visions of using mine than most conventional buyers and hams bought them for . I only wish that they would go ahead and open it up in the firmware to allow it to go down to say 50 kHz. That would allow us to listen to WWVB and to listen to the 4,000 meter experimental band . That is about the only change that is not going to be addressed in the final firmware version , as far as I am aware of.

A couple of guys have also successfully built a speech processor for it that will actually fit into the microphone. A couple of other guys are also working on an interface specifically designed for the X1M , for people that like to build their own , digital modes interface . I know of another person that is working on a very nice small power supply for it . It is a switcher , so it will be lightweight also and he is very

experienced in this field and is going to great lengths to make it very nice and RF friendly to the X1M .

I like to see people getting involved in building projects to enhance this great little rig . It seems the ham spirit still lives on and since I am now one of the old timers , I like to see younger or new to ham radio people get involved in building and helping others .

we need to start pitching the x1m to the open source crowd then they will start to write open firmware for the radio and we will be able to get it to do whatever. If i were any good at programming id take a stab at it but alas i suck

Thanks for your very full response, Charlie.

You have a considerable lead on me, as I have only been licenced for 35 years, although my first tinkering in the hobby commenced 16 years earlier at the age of 14.

In those days, we did not have a novice licence in VK and while there was a code free licence available, the theory and regulation papers were those for the full licence exams. Somehow, the dictates of general education, getting a job and then starting a family got in the way of sitting the examinations until I hit 30. I have had the odd vacation from the hobby in the intervening years, as employment dictated, but then again, one of the huge advantages of the hobby is that you can drift in and out of active pursuit.

In recent years, with retirement, I have turned to SMD and found to my amazement that I can build faster using them. I first have to remove all corrective lens though. I can still focus well on a circuit board from a foot away without visual correction but when I look up, everything beyond that distance is a blur.

That said, the photos I have seen of the kit version of the X1M suggest that it was largely already assembled, really only requiring the interconnection of populated pcbs. a little reminiscent of PC assembly in the 1990s.

I have ordered the AGC kit although I have yet to "pull the trigger", as I think it is known on your side of the world, on purchasing the X1M itself but it is only a matter of time and perhaps wider availability. It certainly appeals to me as an exciter for other experimentation, especially down low.

I look forward to our future development work on this wee beastie, as my forefathers might have termed it.

I do hope that they are planning larger and more frequent production runs of this radio . Does anyone know how many radios are scheduled for production in this November run ?

I am afraid there are more people wanting one , than will be produced . I look forward to wider availability too Bill , so we can have many more people involved in doing more things with this small wonder .

Charlie, and the group,

The plans for the PA0RDT mini whip are here :-

http://www.radiopassioni.it/pdf/pa0rdt-Mini-Whip.PDF

There is a paper by Chris Trask N7ZWY on something similar here :-

http://home.earthlink.net/~christrask/Active%20Monopole%20Amplifier.pdf

There is an AMRAD design here :-

http://www.arrl.org/files/file/Technology/tis/info/pdf/0109031.pdf

but the CP666 transistor is rare, power hungry and expensive....See here
for using the cheaper and easier to find J310

http://www.amrad.org/projects/lf/actant/faq.pdf

As I am stuck in doors with a bad head cold I'll lash up one of the PA0RDT
design but using a
Motorola CG0001 (equivalent to a 2N3866) instead of the 2N5109

Hope this helps....

What power output do you use for your beacon Charlie?

Hi Stephen,
I have been running some comparisons between my broadband 7' shielded loop and my PA0RDT E probe. Not quite fair as the E probe does not have any common mode filtering on it. Both are powered by a Clifton Labs bias Tee. BTW That is the largest difference I see. A properly designed bias Tee makes a large difference in common mode. The Clifton (who also designed the Pixel Loop) Te has a toroidal transformer that breaks the DC ground path between the RX and the Antenna feeder. Also common mode chokes on both the B+ and B- that feeds the Tee. There is an updated power supply in one of the Crawley Club publications that shows roughly how to build such a Tee.

Anyway back to the loop comparisons. I am in a very rural area on a large lake- very few permanent winter residents here so my local noise is very low. I do notice however a dip in the noise level when I rotate the loop so as to place its null on the house. The loop is on a short tower about 200' from the house. The probe, on the other hand, can be swamped with noise from the house. That is the primary difference I am seeing. So the loop has been my antenna choice this season.

On 12 November 2013 00:49, Charlie , W5COV <cvest@...> wrote:

If any of you care to have something to do tonight , I have put my home built beacon on the air 24/7 . Right now it is just for some testing as I am finishing up a new beacon . It is not on my full legal limit length transmitting antenna , but my test antenna does a decent job out to about 500 miles .

The X1M is capable of receiving on this frequency , but like most ham transceivers , is lacking in sensitivity in this range , so I HIGHLY recommend at a very minimum an amplified antenna such as the PA0RDT E-probe or mini whip . Also a good buffer for impedance transformation and an amplifier or external preamp will give you hours of listening fun on the X1M for the 2200 , 1750 , 630 , 600 meter experimental bands and also give you a preview of what to expect IF we ever get ARRL/FCC approval for a ham band at 630 meters and now looking less likely , another ham band on 2200 meters .

Besides ham and experimental activity you may get hooked on "chasing" NDB's , NAVTEX , Foreign Broadcast stations and all manner of stations that occupy the frequencies between 100 kHz. and 510 kHz.

Here is the link to a page that has many simple , cheap , and easy projects you can put together easily in one evening to explore this and even the frequencies below the coverage range (100 kHz.) on the X1M . It is a home hobbyist electronics page and has a wide range of simple , clever , cheap , and easy to build projects for the home hobbyist . It has a matching Yahoo group . called techlib where you will find all of the support for ANY of these projects that you might find of interest . The designer of all the projects offers his personal , as extensive as you require , support for all of these projects . It is a free site and has some really nice "outside of the box building blocks" in case you want to "roll your own" project . The URL is http://www.techlib.com be sure and also check the circuits tab at the top of the page too .

My beacon is running QRSS60 , 24/7 , and is on 185.2984 kHz. with the identifier of CV

Most people start out listening to QRSS and also NDB's with a free program called ARGO , a program designed for weak signal work . It can be downloaded from this URL http://www.weaksignals.com/

There are several free NAVTEX decoder programs out there . If you have any questions , please feel free to ask me .

Just another way to get closer to maximum fun out of the X1M .

wow all of that is really cool info, would you be interested in making more details explanations for the wiki. X1M.wikia.com http://X1M.wikia.com

On Mon, Nov 11, 2013 at 11:32 AM, <neilgoldstein@... mailto:neilgoldstein@...> wrote:
This is just a general wrap-up of everything I have done with my X1M original model to date.

1. QRP Go-kit: I purchased a used custom foam case, and tore out more foam to fit all of the accessories, radio, cord and antenna wires.

2. Tuner: Using the excellent ZM-2 tuner from Emtech

3. Antenna: I have an assortment of 16 gauge wire lengths that I hang when I'm portable, using the water bottle method, or whatever MacGuyver procedures are available given the location

4. Audio: I have not performed the audio mod. I use a tiny powered speaker, which is about the size of a golf ball. Works well.

5. Microphone: Like many of you, I had trouble with the mic connector. I re-soldered and sealed the connection.

6. Out-of supplied filter-range use: For the top part of 80 and 40, I'll wait for the firmware upgrade for the older model. I tested the radio on 17 and 12 on my Elmer's service monitor. 17 was pretty bad. For 17 I am going to order a low-pass filter kit from Kits-and-Parts. 12 was actually pretty clean on the monitor. I had a QSO with Lithuania on 12 a couple of weeks ago, while operating portable.

7. CAT cable: I made a cable by using a CP2102 USB to TTL module from eBay ($2.79 shipped). I semi-permanently connected a USB extension cable to it to get some length, sealing it on with heat-shrink. Then, on the other end I decided I wanted some break-out capability for being able to tie-in to the other 5 pins later on. We've seen in the schematic that they are connected to the LPF/BPF circuits, but I don't think anyone has implemented anything yet. I purchased a D-SUB9 male to RJ45 adapter and connected the pins 1-to-1, 2-to-2 etc. For the initial cable I made the 3 necessary connections to half of a CAT5 cable that I split in two, and tied it to the CP2102 interface, leaving the extra 5 wires for later use. I know I could of just tied it all directly to a D-SUB but this way I have some quick-disconnect options in the field. It works with HRD in Windows, and FLDIGI in Mac, Windows, and Linux. So far so good.

8. "Tune Button": I got tired of carrying around a full straight key just to tune-up. My first implementation of this is just a tiny click-on-off button heat-shrinked directly into the back of a 3.5mm plug. Later I'll move it inside the rig.

9. Power: First, I lugged around one of those jump-start kits. It worked great, as I think I could run the X1M off of this monster for a week or more. At the last LIMARC Ham Fair here on Long Island the "battery guy" was selling these small 4-amp battery packs. Just a bunch of Li-ion cells wrapped with a 12V accessory socket and a charging circuit. Came with a wall-brick charger. Great little battery. I'd post a link, but it's not on their web site. I'll post the model # and company contact in a future post as well as a picture in case anyone wants to order one. I think it was $40. It even powers my HTX-10, or any of my dual-band VHF-UHF mobiles (on low power)

10. Future: I pre-ordered the upgrade kit from Ed at Import Communications. Looking forward to that, and the firmware upgrade. I'm planning on a SingaLink USB interface or the SCI-6 from Unified Micro for digital modes. Once I have everything the way I want it, I may replace the garage-sale case with a real one. I'm considering an amp. possibly the HardRock 50 kit.

DX Contacts (all SSB):
10M: Guadeloupe, Antigua, DR, Fr. Guiana, Argentina, Columbia, UK, Mexico
12M: Lithuania
15M: Venezuela, Germany, Denmark, UK, Scotland, Azores, Ukraine, Slovenia
20M: PEI Canada, Czech Rep, Denmark

I'm happy with this.

When this idea first came up I said,

I like to keep all the information in one place to make it easier to find. The current Yahoo Group works for me. Our messages are there, our photos are the and our files are there. I don't think if you can put files and photos in a wiki.

Lee – N9LO

REMOVE MY MICROPHONE WIRING DIAGRAM. IT HAS MY NAME AND CALL LETTERS ON IT. You have published it another location from where I put it.

Moderator, would you please remove this thief from this group.

Lee – N9LO

2236. UK Calling

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-13 01:16:51 UTC
From: m5zzr@btinternet.com
Topic: 2236 Message: 2236

It's a happy Tuesday for me, my UK - X1M arrived from Moonraker.
I'm delighted to see that the models intended for the UK market are
BNC equipped. The advertising photographs showed an SO-239 and
that's what I was expecting.

So far, I've only transmitted into a metered dummy load - my
antennas are currently down due to weather - I should be able to get
them back in the air tomorrow, it is producing about 4.5 watts of SSB on
all filtered bands.

40 meter stations were strong enough this afternoon for me to receive
with the antennas on the ground; my radio seems to have plenty of volume
(for now) and a very low noise floor. The recovered audio is well
rounded and pleasant to listen to, I guess the volume mod will still
need to be done for AGC purposes though.

I've posted a number of pictures showing the front panel, the rear
panel including the "HEAD-HPONE" socket - HI and serial #, the
supplied microphone and it's interior and the interior of the 3.5mm
microphone plug prior to it receiving some attention.

A couple of QC niggles to mention but not enough to disappoint;

the microphone plug that others have noted (now resolved);

the F3 button didn't work at first and I had to pull it nearly out
and push it back in several times before it located and started working,
all the `F' buttons seem a bit wobbly, but they do the job
faultlessly save the above issue;

the external speaker socket is intermittent , full volume failing to
re-appear when the plug is removed □ pushing the plug in and pulling
it out again resolves the problem but it's very touchy, I think it
may well settle itself with use;

the BNC socket was loose as were the case screws.

It might sound a 'little' gloomy but I'm very happy with my
purchase, all the important things appear to be in order and, as for the
QC issues? Easily resolved.

I'll follow up when I've aired it proper, So far I'm
thrilled! WHAT a super little rig and what a super group.

I foresee FUN ahead!

Mel. M5ZZR.

Whoever is working on the Wiki would do well to first read through 'Title 17 of the US Code', regarding Federal Copyright law and the penalties possible for those violations. Any work created is automatically protected by US Copyright. Whether written, a work of art, music, video, schematic, etc. and MAY NOT be used, copied, published, without the permission of the creator (other than 'fair use' - look it up). Besides, it just good manners to ask before posting anything that you did not create. It is not necessary to include a Copyright Notice or the Copyright Symbol with a work to obtain Copyright. It is automatically bestowed upon creation. Trademarks are another story, but not part of this discussion.
Many times the creator of a work will allow publication, if attribution is made and the work is not altered in any way. But, ALWAYS ASK FIRST.

I don't know about the USA but in Australia, copyright means just that... the right to copy. It does not matter if it is for education or public interest. Whether anyone makes any money is irrelevant. The creator is the owner and no-one can use their material without their permission... Generally provided in written form. As far as I'm aware this does apply world wide. If the unnamed author thinks groups are now "old hat" and should be replaced by the new wiki technology so be it. I suggest he write his own data and post that for all who may be interested. Ian (VK3YIC) Sent from my iPhone

Your 'definition' of Fair Use is wrong. Does not matter if there is any money being made. Giving attribution does not allow publishing content not your own. Educational purposes does not trump the right to restrict publication of materials not your own. Try publishing any other copyright protected material, say a Harry Potter novel, or just a chapter of the book, for 'educational purposes' on a wiki page and see if your definition of Fair Use holds up.

Yahoo Groups have become a pain in the gluteus maximus lately, I agree. Even though I will not live in a HOA restricted community in the real world, I do prefer a 'gated' community online. Wiki's do have their purpose, and I encourage you to pursue the X1M wiki, but use your own material unless you have gotten permission from the creator (copyright holder) of anyone's content you wish to publish.

This advice is offered Pro Bono and intended to give you enough information to keep you out of trouble in future.

I am not a lawyer, but have just enough legal training to be a danger to myself and those nearby. But, I have been involved in several copyright disputes in the past and have always won.

There's a lot of childish overreaction in this thread over a very trivial matter.

I don't see the issue - no licence was provided and credits have been included AFAIK, but if people are so worried about their intellectual property being abused then I suggest someone less anal about open information access creates clean-room designs of the schematics, etc in question.

Seeing as the data was published for the community of X1M owners in the first place you'd think those who improve the radio for the community would want their accomplishments to be enjoyed by all... seeing as it's not for commercial gain anyway.

As a side-note, Wikis are an excellent way of structuring and presenting information in an accessible, useful way - Yahoo! Groups, Google Groups and other NNTP/NNTP-like services are great as a precursor to Forums but they're not ideal for preserving information in an easy to access, concise manner - having data "in one place" is all very well if that place is easily accessible and organised.

First off, WOW! I have never done anything this small before. Thank you Dale. If you didn't sell it for $11 I would've never tried it. Two questions: 1- what is the proper way to check to see if I bridged anything? 2- what is the other mod I need to perform on the radio when it comes in prior to completing this mod? Again, thank you Dale. If you've never done anything like this before, don't be afraid. Just be patient and take your time. Set up some at to easily catch dropped pieces. I did it once and it was the only time I almost cursed

Hi Mike,
You just have to short out R80C on the bottom of the top board. Charlie has posted a couple of notes on doing this. It is easiest (from memory now) to run a very thin wire from Pin 1 of the LM386 to the (+) side of C155C. All on the bottom of the top board. The audio amp IC is right near the edge of the PCB, so this can be done w/o having to remove the board.

Subject: [X1M_QRP-Transceiver] Mod question

First off, WOW! I have never done anything this small before. Thank you Dale. If you didn't sell it for $11 I would've never tried it. Two questions: 1- what is the proper way to check to see if I bridged anything? 2- what is the other mod I need to perform on the radio when it comes in prior to completing this mod? Again, thank you Dale. If you've never done anything like this before, don't be afraid. Just be patient and take your time. Set up some at to easily catch dropped pieces. I did it once and it was the only time I almost cursed

2253. Re: UK Calling - On Air.

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-11-13 17:03:25 UTC
From: m5zzr@btinternet.com
Topic: 2236 Message: 2253

I did manage to get the antennas back in the air today and managed a couple of QSOs. What a really super radio this is. I love the frequency navigation, (once I got used to it) jumping from band to band is easy.

On 40 meters, which is where I managed a couple of QSOs, there is more than enough audio and the noise floor is so low. As one moves up and down the band, there do seem to be segments where the receiver is more or less sensitive but this could be variations in signal to noise, it's too early for me to tell. Quite a few birdies too.

Working into a dipole at 6 meters AGL; I got 20 over 9, lovely audio from a station about 200 miles away and 5 x 8 from a mobile about 400 miles away, again complimenting the audio.

On 10 meters the noise floor is so low that the radio seems as if it's turned off, but springs to life for strong stations at least. I wouldn't be surprised if sensitivity is down on the higher bands; it seems this way, even with the pre-amp on, but I haven't compared with another radio alongside yet. I made some calls but got no replies on 10 which doesn't really surprise me.

Long-wave 198kHz BBC world service was loud and clear as were medium wave stations, and identical on both side-bands.

The F3 button is still a tad troublesome and I think I'll have to get the front panel off to look at it - the control knobs do seem very tight though and I'm somewhat reluctant at this stage.

So! Not much of an airing yet but an airing nevertheless, very satisfying. I'm so pleased to have purchased this one. I was really only looking for a simple single band CW kit to use as a signal source in the workshop when I found the X1M. There is no way that this is going to be relegated to that role so I'm still looking.

My next job is to manufacture a handlebar bracket for bicycle mobile.

Because of the solder mask, shorts would be difficult except on the op amp. A good lit magnifier should reveal any issues. Very important to use a small tip and very fine solder- that will make it difficult to dispense too much solder onto a joint.

GA Mel,

I don't know what particular type of signal source you are looking for
but http://www.qsl.net/k5bcq/Kits/Kits.html has a frequency synthesizer
kit available that might do what you are looking for and it is a whole lot
cheaper than a X1M. :-)
